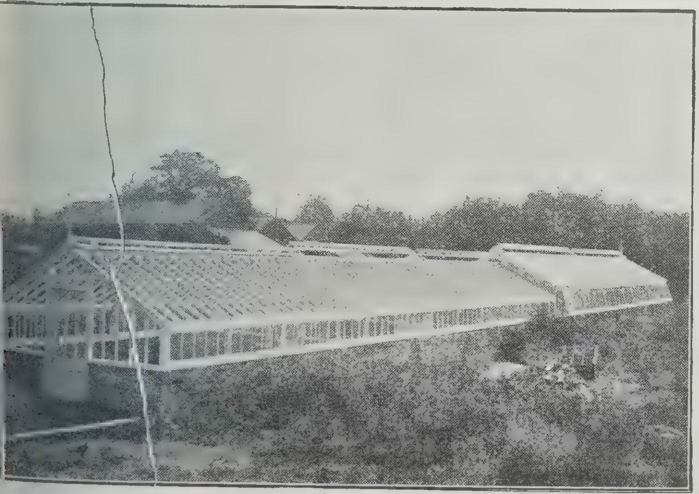
FOSTER AND PEARSON LTD.
BEESTON - NOTTS.



GOOD GREENHOUSES LAST
OTHERS DO NOT.

We have recently received a letter from a gentleman quite unknown to us as follows:—

> "The houses erected by you many years ago have been re-erected at Hayes, and I can assure you they are in a wonderfully good condition; in fact worth photographing for publicity purposes."

We accepted his suggestion and this view is the rebuilt range of glass originally erected by us

FORTY-FIVE YEARS AGO.

FRAMES FOR THE GARDEN

A customer sends us this photograph. The two Frames were purchased by him

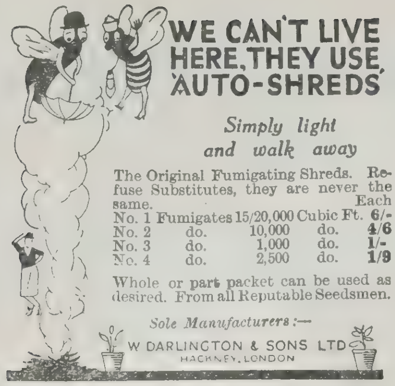
TWENTY YEARS AGO;

that on the right, from FOSTER & PEARSON, LTD., has stood the test of time, and is as sound to-day as when it was supplied; the condition of the other speaks for itself.

PROFIT by the EXPERIENCE of OTHERS AND ORDER FROM

FOSTER & PEARSON, Ltd.,

who for Eighty Years have upheld their reputation for sound work.



WE CAN'T LIVE HERE, THEY USE 'AUTO-SHREDS'

Simply light and walk away

The Original Fumigating Shreds. Refuse Substitutes, they are never the same.

"Lefco" Garden Ornaments

turn once neglected corners into centres of attraction.

No garden is altogether perfect. Somewhere there's a corner—a little patch of ground—that never seems to be right. Maybe too much shade prevents rich blossoming. Perhaps the site of some old rubbish heap betrays its dead past in over-luxuriant weeds—whatever the cause it is there—the blank spot—the bit that never satisfies.

Just as you feel, others have felt—and have found the way out. One man placed a "Lefco" Bird Bath in his neglected corner, and now it is the centre of interest. Another decided a "Lefco" Vase would form a pleasing centre to a small rock garden, which with the changing seasons displays a riot of successional blooms, brightening and completing his garden picture. Others, too, have used Sundials, Fountains, Figures happily placed. "Lefco" Garden Ware everywhere adds charm to neglected corners, turning places you previously avoided into pleasant resorts.

The range of "Lefco" Garden Ornaments includes over 60 models ranging in price from 15/- to as many guineas. There are Vases, Bird Baths, Sundials, Figures and Animals, all made of the imperishable "Lefco" Ware. Frost will not crack it, rain and wind will not spoil it. It stays beautiful for ever. Ask to-day for complete Catalogue, sent post free. Fill in this coupon now.

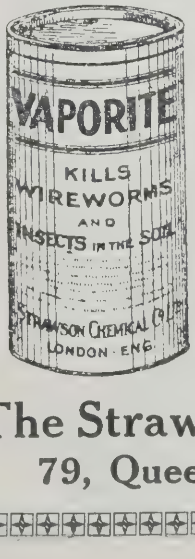
GEO. JACKMAN & SON - WOKING - SURREY

Destroy all Grubs in the Soil

In most gardens insects in the soil do immense damage; seedlings are killed; flowers suddenly wither; carrots are disfigured; the unseen insect works havoc among all plants.



Now when digging and preparing your garden, scatter some Vaporite upon the soil and work it in at the rate of about 1½ lbs. to every 10 square yards. **In three days you will see the insects lying dead.** The Vaporite is non-poisonous and pleasant to use. It is the standard Insecticide with the largest sale in the world.

Vaporite

LILFORD DRIVE NR. PETERBOROUGH
(Photograph by courtesy of Rt. Hon. Lord Lilford)

One drum, containing 30 gallons, costing 40/-, delivered direct to destination within the Railway Company's free delivery area, will cover approximately 100 sq. yds. of gravel drive or path. A considerable reduction is offered if two or more drums are ordered.

Write to Estates (K) *Dept. for 24-page Booklet and Prices.*

New Drives for Old

A Colas Surface!

The amazing growth of the motor industry has created a problem which concerns every estate owner—the most economical method of maintaining ordinary gravel drives under modern traffic conditions.

COLAS solves the problem. COLAS arrives *ready to apply*, and can be put down at any time of the year by anyone without skill or special apparatus. COLAS provides a clean, hard, lasting surface at a low cost.

SUTTON'S SEEDS

The Value of Annuals

Spring Flower Beds and Herbaceous Borders have, everywhere, suffered most severely during the great Frost of February. To replace the plants thus lost, the following Hardy Annuals will be of incalculable service :—

Calendula, Candytuft, Cornflower, Chrysanthemum Clarkia, Coreopsis, Dimorphotheca, Eschscholtzia. Godetia, Larkspur, Lavatera, Nasturtium, Phlox, Shirley Poppy, Scabious, Swan River Daisy, Sweet Sultan.

For complete descriptive list of the best varieties see "Sutton's Garden Seed Catalogue for 1929" post free.

Sutton's Collections of Hardy Annuals **4/6, 8/6, 12/6** and **17/6,** post free.

Progress in the Cultivation of Rhododendrons

HE first edition of Nicholson's "Dic- onary of Gardening," published about 886, states that the number of known s of Rhododendron was then about 100, is doubtful whether all were in culti- h. Mr. E. H. Wilson's first expedition ina in 1899 resulted in the introduction number of fine new species, and com- ed a new era in Rhododendron cultiva-

son was quickly followed by other id collectors, notably, G. Forrest, ald Farrer, and lon Ward, who each discovered new species until umber of recog- species is now be- 700 and 800, g in stature from rostrate R. repens e growths cling y to the ground) giganteum, which uted to reach 80 height.

foliage of the s species also a wide range in on, from R. sino- e, whose leaves gigantic propor- to the minute- d R. orthocla-

ing as they do higher altitudes, of these new s are hardier than older Sikkim- ayan species, con- tly, they are suited for general tion.

ble species intro- by Wilson include auriculatum, R. chenense, R. calo- n, R. Fargesii, R. Moupinense, R. iclare, R. intricatum, R. Vernicosum, isonii, R. Sargentianum, R. Ririei, R. gosum, and R. Williamsianum.

are indebted to Forrest for the intro- n of more species than probably any r single collector. These include R. enianum, R. repens, R. sino-grande, eotrephes, R. ledoides, R. sphæran- R. callimorphum, R. diatrepes, R. taile, R. croceum, R. didymum, R. ein, R. hippophœoides, and R. dichro- hn.

ngst Kingdon Ward's contributions . calostrotum, R. aperantum, R. ysm, R. myrtilloides, and R. euchroum.

To the late Mr. Reginald Farrer we are especially indebted for the fine R. sperabile. There are a large number of species, the proceeds of Mr. G. Forrest's and Capt. Kingdon Ward's more recent expeditions, which have not yet flowered in cultivation. Many of these species are of such dwarf habit and compact growth that they are especially suitable for gardens of moderate dimensions. Moreover, they should be perfectly hardy, for they come from the Alpine regions of China and Thibet.

Rhododendron Loderi King George

A magnificent hybrid, white or palest flesh, the large flowers over 6 inches across, opening with great splendour. (Parentage, R. Fortunei x R. Aucklandii.) Must be grown in shelter and partial shade. Reproduced from a truss grown in the Bodnant Gardens

The constant stream of new species has spurred growers to keep pace by improved cultural methods, but the problem of growing Rhododendrons on calcareous soils has not yet been solved, and this debars many would-be enthusiasts from cultivating them. Recent experiments, however, have proved that certain species do not show that strict abhorrence of lime which is so characteristic of the older species. One notable example, R. rubiginosum, has successfully withstood very severe tests, and probably some enterprising nurseryman will try the experiment of using these as stocks for grafting or as a basis for breeding a race of Rhododendrons which can be successfully grown in gardens which are moderately calcareous.

As the new species flower, Rhododendron enthusiasts are using them for systematic hybridisation, and with the guiding hand of man applied to the forces which Nature has supplied so bounteously the future progress of Rhododendrons is assured. New forms and colours introduced by hybridising and the flowering season is prolonged.

F. C. Puddle.

Bodnant Gardens,
Tal-y-Cafn, Denbighshire.

Holly hedges

The theory is generally advanced that the Holly is a slow-growing plant, but there appears to be room for inquiry as to what is its actual rate of growth, for in all probability, when well situated, it grows considerably faster than the hypothetical rate assigned to it by public opinion, and, although its growth may be relatively slow in the first year or two, remarkably fine hedges may be obtained in from 12 to 15 years from planting if attention is paid to the needs of the plant.

The Holly is not a fastidious plant as regards soil, and grows freely in almost any position where shrubs generally succeed, but it has a preference for the lighter types of soil, rich in organic matter, and frequently makes growth of 15 inches or 18 inches in the year in such soils. When planting on soils of such nature the preparation will be, naturally, of the simplest, consisting only in thoroughly working the ground to a depth of 2 feet, but where the ground is poor liberal additions of decayed manure should be incorporated with it during the process of preparation.

In planting to form a hedge plants up to 5 feet or 6 feet in height may be used if desired, the distance of planting depending on the size of the plant, but better results are generally obtained from smaller plants, as they are usually well furnished at the base. Whatever the size of the plant, firm planting should be practised.

The season of planting may be a debatable point. Generally speaking, Hollies are not the easiest subjects to transplant, and in all cases precaution should be taken to prevent undue exposure of the roots to adverse climatic conditions. There is no doubt that early autumn planting while the soil retains its summer warmth is a favourable time, but excellent results are also obtained from spring planting, and particularly during showery weather in April. When late planting is practised it is always wise to give a good watering and mulch the surface with rotten manure. After-treatment consists in clipping the hedges as required, and where broad hedges are desired it is necessary to slightly taper them towards the top, as if cut perfectly square there is danger of the top spreading, particularly under weight of snow.

Hedges carefully planted and trimmed back annually make impenetrable fences in a few years, and if they are cut back fairly hard for the first year or two to induce good furnishing at the base it is an easy matter to extend the height afterwards to whatever degree may be desired.

W. AUTON.

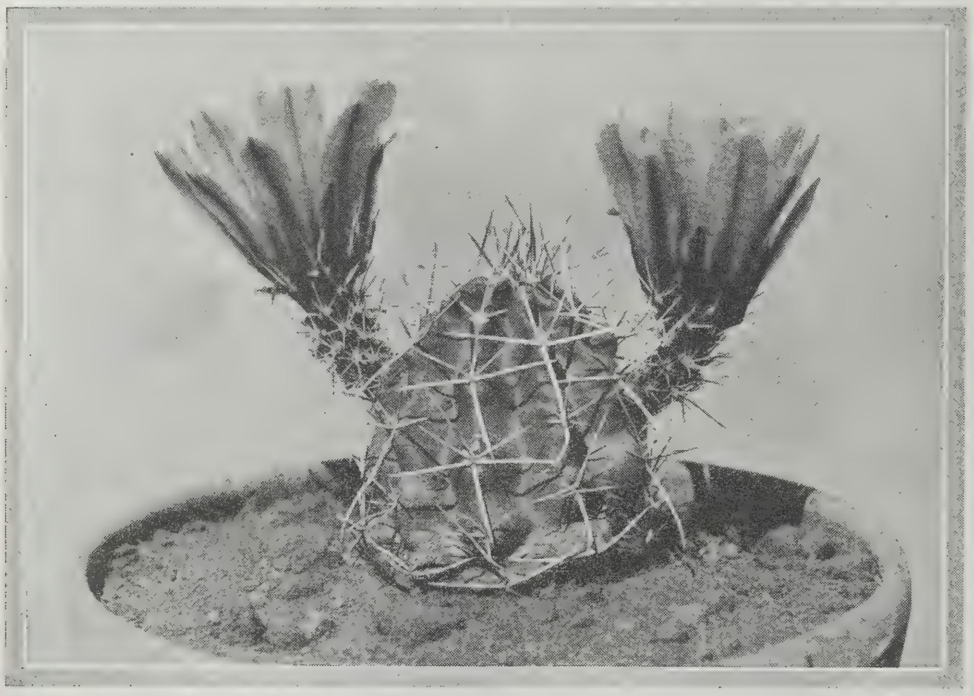
Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Echinocereus Fendleri

THIS is one of the semi-hardy Cacti of N. America. It will stand a temperature of 15 degs. above zero if kept dry. Some idea of the size may be had by comparing with the pot, which is 8 inches in diameter. The plant is about six years old and has not as yet developed the brown-tipped central spines. The flower is rose-purple with darker midrib. The body is dark green, spines white, brown-tipped. JAMES ALLAN.

Mountain Park, New Mexico.



Echinocereus Fendleri, flowers rose-purple

Sisyrinchium grandiflorum

I have been interested in the correspondence about Sisyrinchium grandiflorum. I have known the plant for 35 years. It grew and flourished at Bogend and Coldstream, Berwickshire. I took a large clump to Edinburgh, but there it did not do; gradually pined and died. Four years ago, on leaving Edinburgh, I was given another clump, and here (over 500 feet) it is at home again. My experience as to other varieties of Sisyrinchium coincides with that of Nin-Nin (your issue of 23rd ult., page 121), from S. striatum to the small-growing Blue-eyed Grass (S. angustifolium bellum), which is so pretty in sunshine.

In 1913 I bought S. striatum and was surprised to find the leaves like a German Iris, but put it away as the flowers were sparse, with no show, and it seeded all over the place. Not till three years ago did I try others, when I raised from seed S. filifolium, S. convolutum Bowles' Variety, and S. convolutum. S. filifolium has Rush-like leaves similar to grandiflorum, but the bells, which are whitish, are more open and about half the size. Last year it flowered for the first time, so may improve. S. convolutum is somewhat similar to the "Blue-eyed Grass," but does not flower so freely, and is seeding like S. striatum. S. convolutum Bowles' Variety did not stand our winter.

A plant that is flowering now and I have never seen in amateur gardens is Adonis amurensis. It was in bud when we had the recent intense frosts and is none the worse, and for the past week has been in full bloom. In Berwickshire Adonis vernalis never did much, while in Edinburgh it was always a mass of bloom, and again here it is not doing so well.

Your paper is not only a thing of weekly interest, but has proved a great help in many ways. A thing that is interesting me just now is the varying hardiness of herbaceous plants, some proving hardy on the east and not on the west, and *vice versâ*.

FALADAM.

Growing alpines in ashes

I was much interested in the article by F. H. Fisher in your issue of February 23rd
on "Growing Alpines in Ashes." May
that I find ashes invaluable on our
heavy soil? Our seed beds are made,
by putting a 2 feet layer of ashes well s
with a strong solution of permangana
potash and water to keep away insects.
this is placed the usual light soil suitab
seed-sowing, about a foot of it. I fin
very successful indeed, and seedlings d
damp off as they sometimes do on
ground. (MRS.) EMILY M. BU

Violettas

I have read the interesting notes b
Stevens on page 142, issue March 2n
which he discourses on the beauty o
Violettas or miniature-flowered T
Pansies, and appreciate to the full all th
says with regard to the various speci
Violas enumerated therein. He is in
however, in referring to them as Viol
To describe these various species of
as Violettas simply because they are s
flowered is quite a misnomer.

The Violettas originated in the gard
the late Dr. Charles Stuart, M.D., of C
side, Berwickshire. In 1874 Dr. Stuart
successful in crossing the Pansy Blue
with the well-known Viola cornuta, o
Pyrenees, and the progeny of this intere
cross was seen in some most pleasing
tions. For some years subsequently
Stuart persisted in his praiseworthy ef
and in 1887, in a batch of seedlings, he
a plant with lovely white flowers of m
ture proportions and beautifully al
scented. The beauty of the flower wa
hanced by a suffusion of yellow colouri
the lower petal. This seedling was
named Violetta, and this name was us
the descriptive name of all mini
flowered Violas of this type.

At a Viola Conference held in the Bot
Gardens, Edgbaston, Birmingham,
August 3rd, 1894, a paper was read d
with these miniature-flowered Violas,
their properties were defined as follows

(1) *Form.*—The flowers may not be
lar, as in the florists' Pansy,
narrow and more oval in form
the petals smooth and of good
stance.

(2) *Colour.*—The colour should be b
clear, and striking, whatever the s
The eye should be bright go
orange, and may run into the
the under petal, but *no central*
marking is admissible, and wh
shaded, edged, or self-coloured
colour should be well contrasted.

(3) *Fragrance.*—The flower shoul
highly perfumed, which property
of the invaluable charms of the t

(4) *Size,* as a point of excellence i
type, deserves consideration, as
part from the broad lines gen
laid down for florists' flowers, an
sider the flowers should not be
than 1½ inches across as a maxi
and 1 inch across as a mini
Flowers ranging between these
will afford ample ground for a
tion, and will be more suitab
small glasses or the exhibition s

(5) *Habit.*—The habit of the plant
be dwarf and procumbent, the f
small and bright, the leaves clo
gether, the joints short, and the
bushy, with flower-stalks of
length as will bring all the fl
well together.

The foregoing properties were duly a
by the Conference, and have been reco
by reputable authorities since that date

The true Violettas flower in the gr

ısion, and invariably carry their flowers above the foliage. The habit of the ts is ideal for the rock garden and as an ng for beds and borders. The plants ess a strong constitution quite perennial aracter, and I question whether there is other hardy plant that flowers so long so continuously as does the true Violetta. ve plants that have been in the same ion for many years, and in the spring of year are represented by beautiful tufts with the first approach of genial her, come into blossom and continue to r until the autumn.

ıce the decease of Dr. Stuart it has been ood fortune to raise quite a large number of beautiful Violettas which, unfor-ely, I have not yet passed on to the alist to distribute. I hope soon, however, something in this connection so that who are interested in these plants may in the joy that has been mine for some past.

ere are many catalogues issued to-day ich there is included under the head of lettas " quite a number of species and ies of species that are in no respect so iful or as interesting as are those true pe, and it is a great pity that the flower- public should be misled into purchasing s that are not what they are represented

D. B. Crane.

Iris stylosa (unguicularis) var. angustifolia

ITH the flowering of Iris stylosa there annually appears a good deal of correspondence concerning the advisability itting back the masses of evergreen e which this species produces. Whether reatment always has the desired effect mulating flower-production is, perhaps, ionable, but there is no doubt that re-l of some of the leaves allows sun and ore easily to reach and " ripen " the nes. With the small variety, angusti- such drastic pruning is unnecessary, as eaves are less numerous and much wer. Of this variety Dykes writes in Handbook of Garden Irises " that it in flowers freely until March or April. therefore, rather surprising that after es of severe frost this plant opened per-lowers under a south wall at Wisley on n 6th, when the photograph was taken, ıgh on the previous morning 20 degs. st were recorded on the grass. Many ned buds seemed at the time to be un-d. The Wisley plant is of a good form, rich violet falls clearly striped at the twith golden-yellow.

N. K. G.

— I have seen the interesting corre-rence which has appeared in your ns lately on the Iris unguicularis. One which I transplanted three years ago lanted in a raised position in a small garden facing south-west has been ring for the last two months, and more rs are to come. There is lime in the nd it gets baked in the summer (if a al one). In a dry position such as this, the soil not too rich and free from re, the foliage does not grow very iantly or require cutting down. For s to blossom well a poor and dry soil r to suit them best, and when once they become established and have acquired owering habit the roots should remain turbed.

H. H. Warner.

sex.

— I have a low wall in my garden 75 long and have had for 20 years the length planted with Iris stylosa, so ps I may claim to have some experience wing them. My soil is very hot, stony l and sand, and it is lime-free. My experience is that they never bloom the winter after being divided, and they should only be disturbed when absolutely necessary. When replanting I have some leaf-soil and lime-rubble dug in.

I find they bloom very freely after a hot, sunny summer, and not well after a cold, wet summer. I do not think the Torquay treatment proves anything, as there they are growing in an ideal situation and climate in a sub-tropical garden.

I never have the leaves cut and flower them after a hot summer quite as well as the Torquay plants. The thick foliage will shelter the buds from 4 degs. or 5 degs. of frost, which they would not stand if it were cut off in autumn.

I have no experience of growing Iris stylosa in heavy soil, but I think, provided one has a S. or W. position under a wall, anything may be added to the way to grow them as recommended by Mr. Percy Chappell, who is evidently, like myself, an enthusiast over this beautiful flower. If the weather is mild I have blooms from November to April; even when the buds are destroyed by frost four or five mild days bring up a new supply. I have always found this Iris bloom well after a hot summer and poorly after a wet and sunless one. The white variety does not increase much with me, as other correspondents find. I wonder if it would respond to a rather more generous treatment.

Churt, near Farnham. C. G. O. Bond.

Iris stylosa var. angustifolia

Flowering in March under a south wall at Wisley

Feeding birds

May I add to Mr. Courtney Page's note that we found the blackbirds and thrushes preferred Apples to anything else. There are, generally, abundance of small and shrivelled Apples in the fruit-room after Christmas which are of little use for anything else.

C. G. O. B.

Churt.

Primula farinosa

AS a dweller in the heart of one of the chief haunts of this delightful native, within a stone's throw of half-a-dozen spots where it is one of the glories of spring, I am particularly interested in Mr. F. H. Fisher's notes on p. 36. The more so, I may say, because for years I have grown it in at least five quite distinct positions in the rock garden, with so great a measure of success, that of the 250 or so plants originally collected, I do not think, in a period of eight years, I have lost half-a-dozen, and, what is still more to the point, the tiny plants I have collected and planted during this time have steadily increased, and by now have formed, in many cases, clumps of such extent that, in one instance alone, last year, I had 32 blooms open at the same time! Further, they seed themselves quite nicely every year, so that in a short time a single collected plant has, with me, become a little colony on its own hook.

Contrary to the experiences of so many, besides Mr. Fisher, who, I have noticed, find this plant difficult, I myself have been particularly struck, and so have others who have seen them, by the great increase in vigour, in height of stalk, and in size of bloom exhibited by most of the plants collected from their local haunts and planted in the various positions in the garden. Stalks of 8 inches, with as many as 20 florets or " pips " to a " head," are by no means uncommon on plants which have been under cultivation no more than three years. And this, though the less fortunate may hardly believe it, occurs with me irrespective of aspect, soil, or other conditions. A single crown plant, for example, with, perhaps, two heads of bloom on 3-inch stalks, collected eight years ago, is by now a clump of 20 or more crowns (but, be it said, with little deviation as regards normality of foliage), in a solid mass, bearing heads of bloom in number and size such as I have mentioned above.

This experience leads me to wonder more and more every time I read of difficulties such as Mr. Fisher mentions.

In view of this frequent disappointment, perhaps, a few more details of culture and so on may be helpful and suggestive, for Primula farinosa is, undoubtedly, so well worth having in good form in our gardens. To many, besides myself, here it has been a sheer delight, and the centre of much admiration and discussion.

All my plants have been collected from haunts round about, in spring when the flower stalks were just showing amongst the foliage—some had a head fully developed—and transplanted in the garden not later than the following day. The first batch were put in either seven or eight years ago, the next five years since, and the remainder—just a handful—two years ago. Of the whole lot, 99 per cent. still flourish, so that the apparently " normal " life as a garden plant, of three years or so, does not seem to apply with me.

And at once I must say, with emphasis, that I have given none of them any special care, nor made the least attempt, by means of special soil, or prepared beds, to make them at home from home. Indeed, there are hosts of plants upon which I have expended twenty times the trouble, and which have rewarded me with general satisfaction as regards permanency and everything else to a much lesser degree than P. farinosa.

Some idea of the variety of situations and soils in which I have them will be gathered from the following brief account of their respective quarters.

At one end of a Rose garden (a totally incongruous position, be it said, thanks to the garden "architects"!), I have two rock beds, at the foot of a "dry" wall about 3 feet high. The aspect of the beds is due north, and the soil is on the moist side, though by no means wet, the beds themselves being devoted chiefly to Alpines preferring cooler and moister conditions, most of them with the additional interest of personal collection. The front edge of the beds is formed by fairly bold, but altogether pleasing and natural, limestone boulders, with here and there a miniature Alpine slope or ravine. Not from any reasons of soil, which, in this case, is slightly peaty, but not "peat," and very stony, but merely because I had the notion that P. farinosa would be effective there, I planted many of my first batch in irregular drifts at the foot of these boulders the whole length of both beds. The gravel of the path merges, I should say, into the soil at the foot of the boulders, without any attempt to keep them distinct. The result is seen in what is, in May, one of the most beautiful sights in the garden—a kind of natural drift of P. farinosa to perfection, save for the fact that where one plant was put in there are now a dozen, and the original roots and flowers have taken upon themselves the abnormal vigour and floriferousness noted above.

Those left over at the time I put in, singly, here and there, where there happened to be a vacant spot, in the crazy paving of the raised terrace round the house, which faces south and south-west, and is one of the sunniest spots in the whole garden. The soil is merely the gritty loam one would find in such a place. Result, the tiny roots have spread until they overcrowd the space they originally had, and a number of seedlings have appeared, as seems to be their wont, in just the right spots—one even in a corner of the paving facing due east. This latter led me, at my second collection, to plant a few in a place where I had very little hope indeed of their existing, let alone progressing. I live in a house which virtually stands on the main road and faces due north-north-east, with no "front" garden at all. But between the wall and the gutter I contrived to make two narrow beds, with soil no more than 18 inches deep and rubble below, using long, narrow blocks of local limestone to form a kind of rockery edge, to retain the soil. Against the house I grow two Roses, a Cotoneaster, and a variegated Ivy; in the beds, bulbs, Wallflowers, Pentstemons, a Campanula or two, and such like, in their seasons. Though everything blooms late, it lasts long, and I am surprised at the success I have had in so small a space and such an aspect. So, as I say, with the self-sown seedlings' suggestion, I planted P. farinosa five years ago, all along the top edge of the stones which retain the beds. They are, without exception, the finest clumps of Primula farinosa that I have ever seen. Passers-by innumerable remark upon them, and ask what they are. The soil here is fairly good, and, from the aspect, consistently moist—though quite distinct from the gritty, peaty mixtures of the rock beds mentioned above. Of the 30 odd plants put in in this case, not one has died, and last year I had, in late June, one clump with as many as 15 flower heads, one of which was on a stalk about a foot long and proportionately sturdy, with a head containing some 30 "pips."

So far, then, in three distinct soils, in aspects so varied as north, north-north-east, west, south-west, P. farinosa has exceeded all expectations without five minutes' trouble, and is permanent.

The remainder in this batch I planted here and there in small colonies on a bold, rocky prominence facing north-west and north, in the ordinary gritty loam, and in the chinks of rough stone steps leading through the rockery, facing south-west. One or two in the steps died forthwith, otherwise the results have been practically identical to those above, though those in the steps seem to have retained more of their normal size and appearance.

The last collection I made, just a few, two years back, I planted in short grass at the foot of a low wall by the steps leading to a sunk garden. Suffice to say they bid fair, so far, to follow in the footsteps of the others.

As I write I wonder whether the Editor will think that P. farinosa merits the lengthy attention I am giving it! Were it not that I believe many will be genuinely interested in this rough account, I should desist. As it is, I feel I must refer to just one or two points Mr. Fisher raises, and to some conclusions I have come to as a result of my experiences with the plant. Rightly does Mr. Fisher note that it is not confined, in its natural distribution, to the marsh. Far too often is it described as a bog and wet loving subject. My first collection was made from the sides of hillocks on a wind-swept moor, with no cover or shade whatever, and from amongst the short, close grass common to such places. There the soil did not exceed six inches in depth, over practically solid limestone, and consisted of nothing but sand and the fibrous roots of the grass. The moor is at an elevation of at least 1,000 feet. The second lot I obtained from the bog formed by the "delta," as it were, of a hillside spring, as it spread over the flat ground at the foot, ere entering the Wharfe, at an elevation of about 600 feet. Here it was a case of water over the boot tops to get it, and the nature of the squashy mass in which it grew will be understood from the fact that, while collecting the Primula, I discovered for the first time, here, Pinguicula vulgaris! A few roots (if it has any) of the latter, which I brought away, bloomed last year, and are, to my surprise, still alive. My other collections were made from the sides of mounds in meadows bordering the river, in the ordinary gravelly soil which is the staple here. So why it should be considered a bog plant alone, or why Farrer should suggest "sticky, very heavy loam" as the best medium for P farinosa I cannot understand. Everything, as I have found it, is altogether against

Cantab, the Cambridge blue form of Iris reticulata

It was in evidence at the last meeting of the Royal Horticultural Society

either suggestion. In this connection I
fairly sure that elevation has somethi
do with success, as also with many
Alpines, and that those in districts su
this may, therefore, do better than
whose local elevation is less. It is s
instance, with Silene alpestris. It g

It is Nature's way.

Rye. F. HERBERT CHAPM

—— Iris reticulata is one of the
charming and deliciously perfumed of a
smaller bulbous plants, and belongs t

ion section of Irises. It is a native of
Caucasus and Palestine, attaining a
t of about 1 foot, the flowers being a
violet-purple colour with a narrow
w line down the centre, and possessed of
olet scent. In favourable weather the
s begin to make their appearance early
nuary, to be followed shortly by the
r-buds pushing up and opening gradu-
until fully expanded, usually in
uary. Iris reticulata is a true com-
n to the Crocus, flowering at a time
many of the latter species and varie-
re in bloom, being members of the same
al order. As the flowering period is
winter or very early spring it is advisable
ant the corms in a position exposed to
sunshine and sheltered from cold
rly winds. They appreciate a fairly
well-drained, sandy soil. They may
be grown in pots or pans in cold frames
cool house, but if grown in this manner
must be allowed to come along natur-
nd not be subjected to artificial warmth
a view to forcing. Planted in colonies
present a very beautiful picture when in
bloom. There are now many varieties
is reticulata in various shades of blue,
e, mauve, etc., a number of which have
ved varietal names. Iris r. Krelagi
s from the type in the colour of its
rs, which are of a slaty-purple, less
ant, and dwarf in stature. Where
small bulbous Irises thrive they are a
ing acquisition to the garden during the
part of the year. J. L.

Roses of fifty years ago

Warratah (Telopea speciosissima)

. Underwood inquires (issue March 9th,
166) about the Warratah. He will pro-
get a packet of seed from Arthur Yates
Co., Ltd., 184-186, Sussex Street,
ey, Australia, if he sends them 1s. 3d.
have supplied me with seed of it. I
d this in January, 1927, and the seed-
began to appear in the following Sep-
er (I have no greenhouse, only a loft),
I did not succeed in keeping them
gh the winter. Messrs. Yates wrote to
hat the seed was not difficult to raise,

Iris reticulata seedlings

but the trouble is with the young plants. The Australian nurserymen lose large numbers of them without any apparent cause. They add: "The seedlings should be raised in sandy soil and not pampered." I fear that your correspondent will not get plants anywhere, though he might try, in addition to the firm you mention, Messrs. Gill, of Falmouth, Messrs. Robert Veitch and Son, of Exeter, and Mr. G. Reuthe, of Keston, Kent.

Cornwall. W. R. J.

Primula Bulleyana

I wonder whether this Primula, discovered by Forrest in Yunnan and heralded as marking an epoch in horticultural history, is still admired and grown extensively as a "glorious" plant? At the Chelsea Show last year there were few exhibits of P. Bulleyana, and it seemed generally to be included only to complete the larger groups, and then was out of keeping with the general effect.

But to give the plant a fair trial let me hasten to state its good points before condemning it as an impostor.

It is the parent of some really lovely hybrids, the colours of which, one's only regret is, have not been fixed. The pale salmon tints, reminiscent of Primula pulverulenta, Bartley Strain, are fairly common, and I have seen a glorious pink, deep and bright, missing the aniline dye effect of P. rosea, a colour which would be most welcome during June in the rock garden.

The second point in its favour is that it is *par excellence* the strongest argument for a standard colour chart of any single flower commonly catalogued. True, the flower varies somewhat according to whether grown in sun or shade, and that unless carefully selected the plants are prone to deteriorate in cultivation, but in 16 catalogues to which reference has been made 14 different colour descriptions are given, and these are worth noting:—"Rich yellow," "apricot-yellow," "rich golden-yellow shaded orange-buff," "orange-yellow," "rich orange," "deep orange," "orange-scarlet," "orange-apricot," "rich apricot," "rich apricot-yellow," "rich golden-apricot," "warm orange-red," "fierce red-gold, developing into clear, pure yellow," "buff, orange, apricot, and scarlet all combined."

May we not consider P. Bulleyana in cold blood and then accurately describe its colours as those of a box of imported cooking Apricots, unripe, ripe, bruised, and going bad. I suppose the trouble is that when first introduced the colour of the flower was a great novelty, everyone was enthusiastic. It was found to be extremely easy, as Primulas go, to raise from seed, and in nearly every case, when included in catalogues, the description was undertaken by men.

To the writer the colour clashes with other Primulas in the small garden, and it is found that women gardeners, to whose most excellent judgment in colour values a tribute was paid in these columns recently, often object to the effect of P. Bulleyana in the rock garden. In this connection it is worth recollecting that its tint has not been copied by the dyer, who now goes more and more to Nature for new shades, whereas Primula

Beesiana, of which Farrer writes it bears "blossoms suggesting a virulently-magenta form of P. japonica" and that "no difficulty, *unfortunately*, attends the cultivation of this plant," registers no suggestion of magenta in its best forms to my possibly depraved ideas of values, and as a colour under the name of "Pavloca" is a beautiful addition to our homes.

P. Bulleyana is not generally long-lived in our gardens. It requires moisture and good drainage to be perennial, and these conditions having been found, probably in the woodland garden, it cannot hold a corner satisfactorily on the merits of its colour, and is not worth growing in these days of so many alternatives. Surely the plant has little more than botanical and hybridising importance to-day.

If we want yellows let us rely on P. Florindæ, P. microdonta, and perhaps P. Sikkimensis for the smaller garden, and darker shades on the diminutive P. Cockburniana, the many hybrids of the Candelabra section, and experiment with P. Chungensis, which bloomed to such great effect last year at the R.H.S. Show. We were then told that this new species would shortly supersede P. Cockburniana, and it will be of interest to note whether the new catalogues will list it, and then test it to see whether it is likely to rank among the reliable and the great. However successful the newer species may prove, there will always be room in an odd corner for P. Cockburniana, even though it be a biennial with most of us, as its brilliance, combined with small stature and neatness, have endeared itself to many.

F. H. Fisher.

The West Terrace at Cannizaro, Wimbledon

The shrub on the brick piers in the foreground is Cotoneaster salicifolia floccosa, an evergreen with gracefully arching branches

Nemesias as pot plants

I had a fine show of Nemesias in the garden last summer, and the warm autumn rains brought up a number of seedlings in the beds where these plants had been growing. I potted up a number of the seedlings and grew them on in the greenhouse.

The experiment has been a splendid success, for I am now rewarded with a brilliant display of many colours—cream, orange, scarlets, rosy-cerise, many shades of crimson, blue, and mauve. As plants for the greenhouse or for indoors they are a welcome addition to the usual Cinerarias, Primulas, and early bulbs, for they give a range of colours unusual at this time of year. They are greatly admired by my friends, and I shall certainly repeat the experiment, even if I have to sow seed specially for it.

Started in quite small pots the plants, as they fill them with roots, should be potted on into larger sizes till the flowering stage is reached in 7-inch pots. Those left in 48 pots require frequent and careful watering, and flag very quickly. The plants should be kept near the glass and given plenty of light or they are apt to become "leggy."

Great heat is not required. My greenhouse has, I regret to say, not always been kept free from frost this winter.

My best plants are about 18 inches high and 12 inches through, and covered with blooms of large size compared with those of their outdoor parents, and of colours quite as brilliant. One great feature is the length of time that the individual plants will remain in bloom.

A. H. Williams.

Horsham.

Clivia miniata

The Clivias (Imantophyllums), of which several remarkably fine forms exist, constitute a group of plants which are amongst the most useful of all exotics for the decoration of greenhouse and conservatory during the early months of the year. With a fairly large stock and a well-devised scheme of culture their attractively coloured flowers may be enjoyed from the latter part of the winter till the beginning of summer by simply accelerating the flowering of some and retarding others. C. miniata is the commonest species and is a strong-growing plant with deep green leaves and orange-red flowers produced in umbels on stout scapes. There are several varieties, in some of which the trusses are larger and the individual flower finer in form and more intense in colour. Amongst beautiful named varieties may be
noted Baroness Schrœder, Scarlet Gem,
F. E. Arnold. Some beautiful varieties
also obtained by Messrs. James Veitch
Sons by crossing C. miniata with the n
Cape species, C. citrina. These bear
trusses of flower varying in colour
bright orange-scarlet to light yellow.

Clivias are of easy culture and succee
a temperature of 45 degs. to 55 degs.
enjoy a rather moist atmosphere and re
liberal supplies of water during the seas
active growth. The best time to repot
requiring more root-space is immedi
after flowering, and propagation by divi
of the crowns can also be effected at
time. After repotting or division of
crowns they should be given rather
warmth and atmospheric moisture than
greenhouse affords, but when well e
lished the temperature of the greenhou
sufficient to meet their needs. The com
should be open and moderately rich,
established plants may be further assiste
watering with dilute liquid-manure at
quent intervals. When growth is compl
at the end of the season, water shoul
gradually withheld, and during the w
they should be kept somewhat dry, but
sufficiently so to cause shrivelling of
foliage. About mid-winter the flower-s
will begin to show signs of activity, and
growth of them can be accelerated by pla
the plants in gentle heat as required.

Sassafras Tree at Cannizaro

is very seldom that one meets with a ssafras tree of any size in England wadays, so rare has it become, and the specimen in the garden of Mr. E. K. on, at Cannizaro, Wimbledon, is almost nly large Sassafras known to exist in ountry at the present time, in spite of act that it was introduced into cultivahere at least 300 years ago. The tree annizaro was discovered by its owner he late Sir George Holford in 1922, who it hidden away in a neglected shrub- the trunk being entirely covered by odendrons, which have since been d away.

had no doubt been planted by some r owner, possibly by the Italian Count whom the garden is named and who here about a century ago. Judging its dimensions—the tree is now nearly et high and 8 feet 6 inches in girth at t from the ground—it is at least 100 old, but during recent times has been d of a good deal of its beauty by the one after another, of two or three large which have been torn off during gales. spring and summer root suckers come ely all round the tree, and one of these, g remained undisturbed for many years, ecome a tree 40 feet high.

ne years ago we tried to transplant two larger suckers to Woburn and Weston- but they proved too big to move, and ly died. This was not surprising as, removed from the light, sandy soil in they were growing, almost every tle of soil fell off the thick, fleshy roots, had little or no fibres.

is, however, possible to move suckers ssfully by taking them up when small rowing them on in a cool greenhouse a little bottom heat to encourage root-

Blue flowering plants

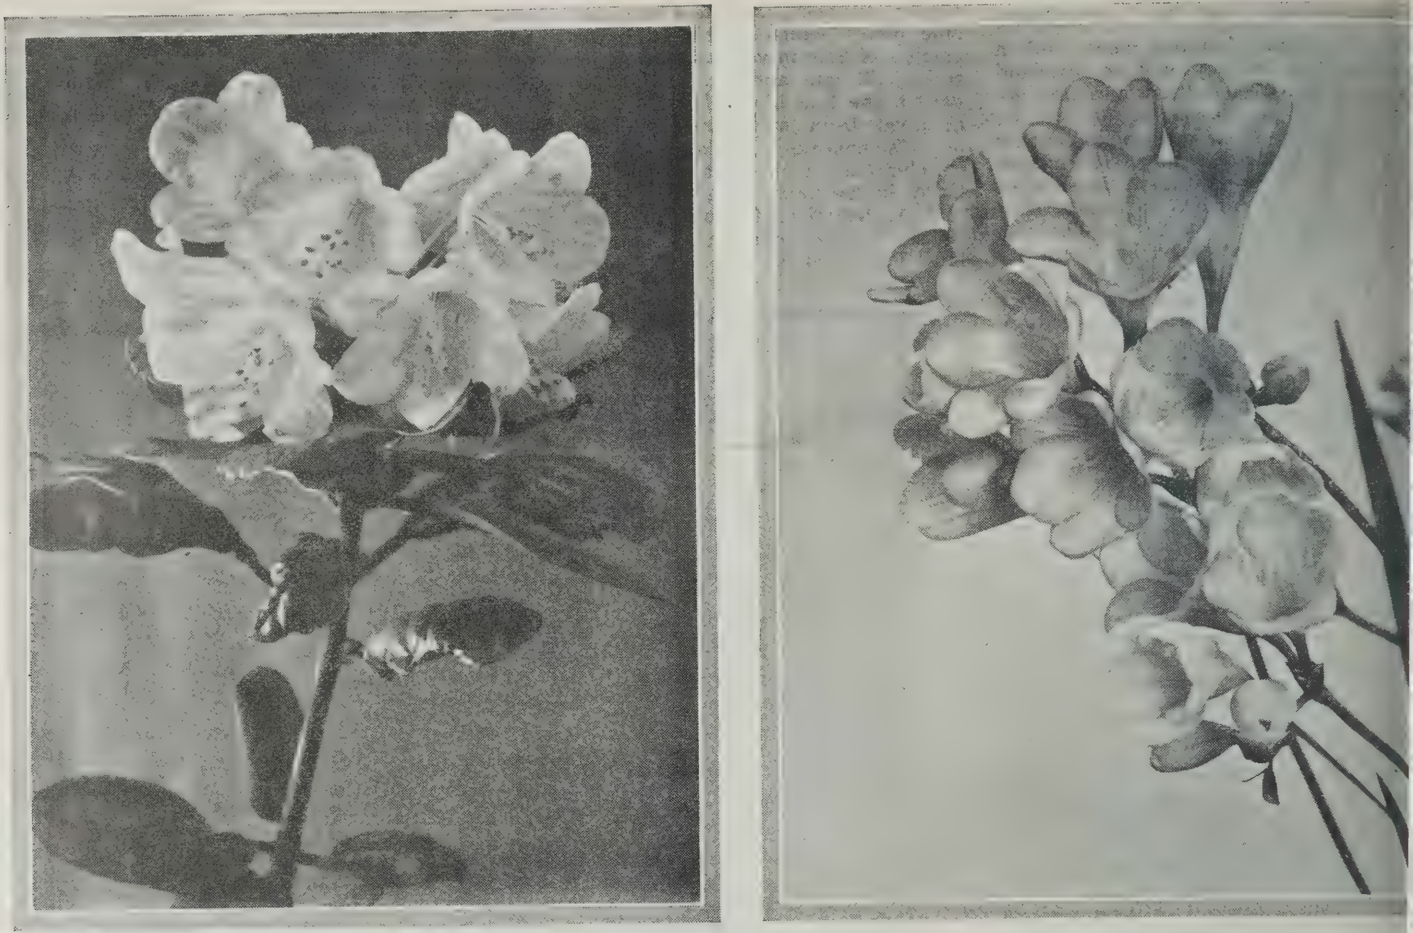
re is a fascination about blue flowers mmon to all colours. The true blue Carnation, and Sweet Pea have yet to appear, but there is quite a long list of good blue plants which enable us to have bold patches of blue in various settings from early spring till late autumn. In the semi-wild garden the first blue effects of the year are obtained from such small bulbous plants as Chionodoxas, Scillas, Muscaris, and Puschkinias, and some of the Crocuses. Early in the year, also, Anemone apennina and A. hepatica, followed by Omphalodes verna, brighten our rock gardens, and the blue Primroses in a goodly assortment of shades, from pale blue to deep violet, fringe our shrubberies. In spring-bedding schemes, also, some good effects are produced by using blue Forget-me-nots, blue Violas, and blue Aubrietias as a groundwork to taller-growing plants.

Turning to the larger herbaceous borders, blue predominates in the June border when the Lupins in various shades of blue and purple are at their best, and the many shades of blue of the Iris show to advantage. In the blue garden proper the stately Delphinium holds pride of place, accompanied by the intensely blue Anchusas, forming an effective background for the dwarf Veronicas, Lithospermum, and Linum perenne. The Scabiosas, many of the Campanulas and Michaelmas Daisies, if not quite so blue as the Delphiniums, contribute their share of blue to the borders, and the Indian Poppies, Meconopsis, and some of the Geraniums are conspicuous in the woodland.

For specimen tubs to stand on the terrace nothing is more suitable than the blue African Lily (Agapanthus umbellatus) and the blue Hydrangea, while amongst climbing plants blue is a predominant colour of the larger Clematises, and the beautiful cup-like flowers of Ipomæa cœrulea may be mentioned.

Amongst annuals are a few wonderfully good blue-flowering plants, notably Nemophila insignis, a plant of straggling, untidy habit, but bearing attractive, pure blue, cup-shaped flowers. A fitting companion is Phacelia campanularia, with dark blue, cup-like flowers which stand erect to the sun, showing the white stamens in the interior of the cup. The quaint Love-in-a-Mist, with its rich blue flowers emerging from a network of fine, green foliage, is a graceful border plant, and even when the flowers have passed, the curious horned seed-pods are very ornamental.

W. Auton.



TWO NOVELTIES AT THE ROYAL HORTICULTURAL SOCIETY'S SHOW ON MARCH 12th—13th

Rhododendron telopœum, flowers pale sulphur-yellow

Freesia Mrs. R. F. Felton (Award of Merit), flowers primrose-yellow

March flowers in Greycoat Street

THERE was room to see the fortnightly show in comfort at the new hall in Greycoat Street, Westminster, on March 12th and 13th. Among the flowers most in evidence were forced shrubs, forced bulbs, Carnations, Orchids, Freesias, and spring flowers brought on under glass.

Orchids were shown extensively, and three Gold Medals were awarded, viz., to Mr. R. Patterson, Ardingly, Sussex, for a well-arranged group comprising Cymbidium and Cypripedium hybrids; to H. G. Alexander, Ltd., for a superb collection of new Cymbidium hybrids; and to Sanders for a collection in which Cymbidiums, Miltonias, and Odontiodas predominated.

COLOURED FREESIAS.—Dalrymple's new Freesias were the best we have seen. Particularly good were Mrs. R. F. Felton, very large, rounded, pale yellow flowers, robust, free-flowering, and deliciously fragrant; Beauty, rosy-mauve with yellow throat; and Maryon, lilac-mauve with white throat—an improved "Wistaria." All three received the Society's Award of Merit.

RHODODENDRON TELOPŒUM. — A lovely species from Tibet, with pale sulphur-yellow flowers. It is not unlike R. campylocarpum, and it was shown by Lady Aberconway and the Hon. H. D. McLaren, Bodnant, N. Wales. An "Alpine form of Yellow Peril," K.W. 5,853.

A number of early flowering Tulips were shown, including the brilliant species Tulipa Eichleri Kaufmanniana and T. præstans.

In many of the groups of Alpines we observed a little Daffodil about 10 inches high with sulphur-yellow perianth and deeper trumpet, shown as Narcissus nanus, which is, we believe, N. lobularis. The true N. nanus is now very scarce; it is less than 6 inches high and of a rich, full yellow.

H. C.

Work in the amateurs' Orchid houses

Commence repotting Cypripediums that have passed out of flower and that are starting to make new root. Almost all growers use a rich fibrous loam to repot these plants, taking care to provide good drainage, half filling the pots with crocks. No manure, unless free from ammonia, must be used, but finely-powdered crocks keep the loam porous. Plants should receive a good watering after repotting, and then should be allowed to nearly dry out before watering again. The mottled leaf section prefer equal quantities of Osmunda fibre and Sphagnum Moss instead of loam, particularly the section including C. Maudiæ and similar hybrids. The Dendrobiums that are showing flower buds should receive slightly more water and the plants should be allowed to become dry before rewatering. The plants of the Odontoglossum family are in various stages of growth, and those that have a flower spike should be protected from the attacks of slugs. A little cotton wool placed round the base of each flower spike will prevent damage, but unfortunately will not get rid of these pests. The only effective method of eradicating these tiresome insects is that known to so many as "slugging." This is a more or less exciting game played at about 10 p.m. of looking for and killing these enemies by any means one prefers. At this season, when fire heat is essential to maintain the temperatures of all Orchid houses, fumigating must be done to prevent the attacks of thrip and other insect pests, as the majority of them thrive in a dry
sphere.

Zygopetalum Mackayi and Z. cri
and other plants of this species that p
flowers from partially-made pseudo b
they require it should be potted at th
son. Some growers prefer to repo
half Osmunda fibre and half Sph
Moss, but I obtain the best results
good fibrous loam containing a libera
ture of finely-broken crocks. All grow
careful to give plenty of drainage and
half fill the pot with crocks. This is
tial, for when in full growth liberal s
of water must be given.

Those of the Odontoglossum famil
require repotting and have their new

EX-AMA

MY GRANDMOTHER

By Sir William Lawrence, Bart.

(Continued from page 183)

DY PEEL AND THE DISRAELIS

1843 Lady Peel, writing from Whitehall rdens, thanks my Grandmother for cuttgs of Geraniums and Sweet Briar, and a later on sends to Ealing a packet of of Cedrus Deodara. The Deodar was luced to England about 1831, and for a many years was expensive and rare. : 1840 the seed was 5s. an ounce, and ngs 10 inches high cost 25s. At Ealing there was a famous avenue of Deodars, he two Deodars in front of the picture ge 183 were planted by Queen Victoria the King of the Belgians respectively. correspondence there is another refer- :o Cedars, when in 1851 Isaac Disraeli from Hughenden :—“ If you will be so ng as to direct your gardener to leave ttle Cedars, wh : you were so kind as ar for us, at the Green Man in your e, Tuckers' Wycomb Van calls there times a week, Tuesdays, Thursdays, aturdays, and will bring them to these wh : I hope will suit them as well as on.”

usements were provided at Ealing Park sitors who might have wearied of the 's. In a letter written by Benjamin eli from Bradenham in 1844 we read : rs. Disraeli has given me your kind and were we not here it would have ted us to meet your Indians in the ing prairies of Ealing. I am glad they oing to meet our Princes, as they will favourable specimen of the nation for iformation of the tribes on the other f the Alleghany Mountains. . . . After campaign we escaped from London to eeches of Bucks.” While Mrs. Disupplements her husband's letter by ad- my Grandmother to “ ask the Indians ie scarf dance, by the women, and ing the ball, a very pretty game, and ake you laugh, dear Mrs. Lawrence.”

STOWE

Duke of Buckingham and Chandos at was interested in everything apperig to the vegetable kingdom. An unletter, probably about 1846, starts the pondence, and then follows a very inng letter written on January 28th, —“ I am glad the Gesners reached you d order; you will not, I hope, forget promise to visit us here, where I am to say I have lost one of the finest kry trees in the garden, entirely decayed, out 150 years of age; it was near the e of ancient virtue.”

do not know if you will be inclined to ise a work about to be published by a Hussey[1] and her sister, a Miss Reed, s a neighbour of mine—probably, as re the daughters of a Buckinghamshire gman, it has been already mentioned to There is, I believe, an interesting work rns lately produced, but *their* subject ns a less inviting branch of botanical wedge. Surrounded as you are by the st and most interesting daughters of how shall I recommend to your notice es of drawings devoted to the often rid and misshapen *funguses*. In the and marshes, nevertheless, they l, and some are curious and beautifully ed. I was surprised to find there was ly so much variety, but also real in some of the specimens, and as illustrating the forest scenery and the decay of the roots and timber, there may be a degree of scientific value in the study of these otherwise proscribed offsets of vegetation. I have, at all events, ventured to enclose the prospectus.

“ Now I must thank you very much for the easy manner in which I was admitted a *fellow* of the Botanical Gardens Society some time ago. . . . On Chandos' return from the Mediterranean he gave us an account of a most superb and delicious Grape or Vine with which the Garden of the Moorish Governor of Tetuan was decorated and his dessert embellished. In Moorish language it was called ‘ The *Lady's Finger*,’[2] but, for love or money, he could not obtain it. The finger was guarded as jealously as the hand. Now I mention it to you in case you might obtain it from *Ibrahim Pacha*.”

Deodar Avenue, Ealing Park

HEAD GARDENERS IN THE 'FORTIES

My Grandmother was frequently consulted as to gardeners, and thus the Duchess of Buckingham, writing from Woburn about the end of the 'forties, says :—“ However, I ought to be thankful for many enjoyments still left to me, and that I have already had so large a share of prosperity, and continue to progress perhaps much more than many around me. I must not therefore allow myself to lament too much the interference which has arisen with the beautiful gardens of Stowe, and led to the resignation of Tillyard as gardener, in which office he gave both the Duke and myself so much satisfaction, that we very much wished some arrangement might have induced him to remain. Chandos also considered him an excellent gardener, and had no wish to dismiss him; but circumstances rendered it necessary to provide for the maintenance of the required labourers, by passing the garden, and *this not suiting* Tillyard and a natural jealousy arising between him and the nursery gardener, we are obliged to let him leave; and I am only anxious he should obtain your valuable recommendation to another advantageous position, as he has married the daughter of a person who has been for a great number of years in the family, as well as on account of his own skill and merit. Now, pray excuse my troubling you, but I know he feels anxious that I should write to you to explain he is not parted with for any fault whatever, but, on the contrary, has given full satisfaction, and has produced two beautiful Vines, and well managed the Orange trees.”

Nor were things altogether satisfactory at Rosebank, a little cottage on the Thames, belonging to Anne, Marchioness of Londonderry. Rosebank is referred to in Maurois' “ La Vie de Disraeli,” in which he writes as follows of a visit to the cottage by the Disraelis in 1850 on the day that Sir Robert Peel died :—“ That afternoon the Londonderrys gave a Rustic Fête at a cottage covered with Roses, on the banks of the Thames. Lady Londonderry poured out tea to all the guests in cups of solid gold. The head of the house pressed Disraeli's hand with an anxious expression in his eyes, and then excused himself. When he returned, after a long interval, he murmured, ‘ There is no hope.’ He had galloped to Peel's house while the violins were playing at the party, and the guests were eating ices.” Lady Londonderry, writing from Mount Stewart in 1844 about the gardener, is perhaps unduly sanguine :—“ I have many

(2) Mr. E. A. Bunyard tells me that the reference is probably to a fingered Grape Cornichon Blanc. This is a Grape of great antiquity mentioned by the Arab botanist who walked from Morocco to Egypt in the 12th Century. It is pictured on the Bronzino ceiling at the Uffizi at Florence, and named by Cupani at the end of the XVII. Century in his Hortus Catholicus. There is, or was, a vine of Cornichon Blanc at Wisley.

thanks to return you for taking so much trouble with Rosebank and interesting yourself with it, and at any time shall be much obliged by any directions you may give the gardener, who will attend strictly without any reference to me, who am sadly ignorant, and am always grateful for any trouble taken.” For the following year, writing from Wynard Park, we learn from the Marquess that things were not going well:—“ I venture to trouble you with a few lines, dear Mrs. Lawrence, on account of your great kindness about poor Rosebank. I ran up to Town for a day to attend the Queen, and got down to Rosebank, and I grieve to say I thought the garden going to the bad; the gardener's wife was decked out with flowers in her hair, very gay looking, and, generally, all appeared in neglect in the garden; nothing done in improvement or begun. Quantities of vegetables unsold, Potatoes said to have the disease, all the houses seemingly to me neglected, and no arrangements made for putting them in order. In short, I confess, though not a judge, and looking only as I see our kitchen garden here, I thought everything very discreditable. The gardener said he was waiting for your orders and designs. This seemed, however, all fudge, as he might have got on in widening the approach, as he projected, and other jobs. All the plants seemed choked up in one house,
and all the pits and forcing houses u

Colour in the Flower Border

By Gertrude Jekyll, V.M.H.

ONE of the delights of careful gardening is to invent and contrive combinations of colour harmonies. One that has proved a success is suggested in the illustration on this page. The tallest plant is Eupatorium purpureum, whose dark stems set off the soft, almost fluffy heads of low-toned pink bloom, with a general effect of pale reddish-purple. The Dahlia next to it is an old one named Oban, of a subdued coppery colour. Just in front of this, and pervading the whole group, though only a little of it shows in the picture in front of the Dahlia, but rising to their full height at the back, is the annual Atriplex hortensis, whose whole colouring is a dusky red-purple, showing at its best when, after flowering, the broad, flat seed-pods are formed. It makes a com
and harmonious setting to the whole gr

The Gladioli

Past, Present, and Future

By “ East Anglian.”

(*Continued from page* 188.)

At the present time, raisers in the
tries mentioned above are still doing
utmost to secure improvements in v
directions. The Gladiolus is one of
flowers which seem to inevitably attra
hybridist, and certainly, in its case th
ample scope. With such a mixed ances
cannot be wondered that modern variet
hibit a wide divergence in form, in bo
Primulinus and the large-flowering c
Very probably the many different raiser
different ideals; of a certainty, they c
all be working on the same lines an

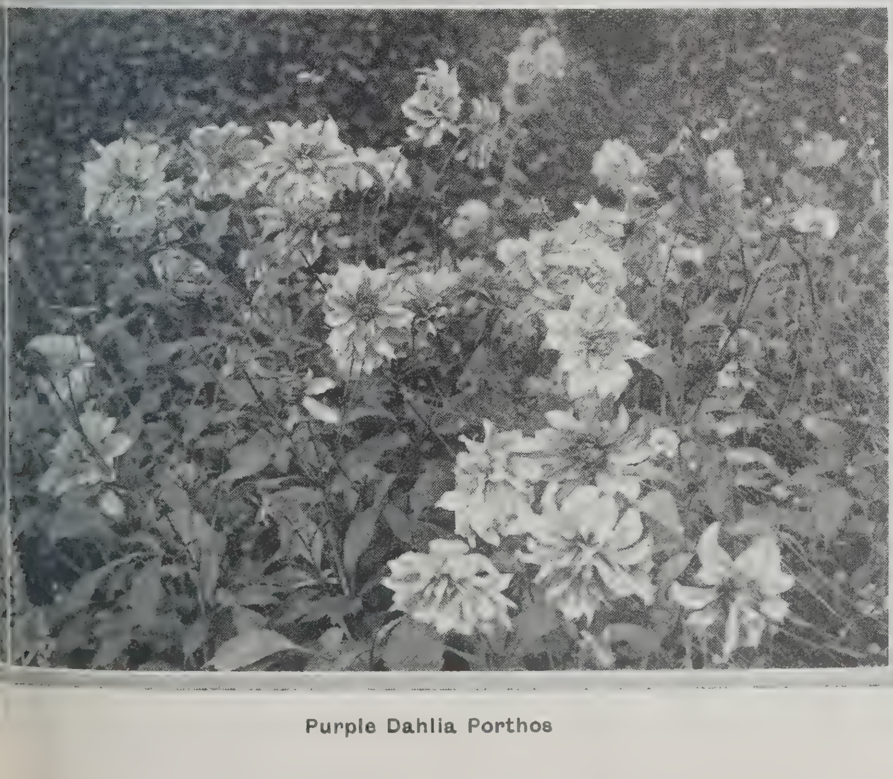
ame objectives. Probably in no other r are there more new varieties introannually, and although it may be said the majority of these do not show any vement on existing kinds, yet a glance ards shows that progress on the whole een by no means slow. The amateur r likes to see size in most of the flowers mires, and to the distributor it is an adge to be able to state that a particular y is exceedingly large. Yet size is not hing; poor placement, for instance, will n otherwise ideal kind. The exhibitor, rse, looks for a large flower, but he more; combined with this must be placement, good shape, and the ten to open out a fair number of blooms time. This is all apart from colour. ps in the large-flowering varieties we t hope for drastic improvement in this ions, the present range is so wide. In linus hybrids there is a greater field, obably through the new "blood" given em we may get better yellows in the flowering kinds, a tone which is rather at present. Good blues and whites, re none too numerous. The ruffled the origination of the American raiser, Kunderd, is an undoubted acquisition. y not have such far-reaching results, as e introduction of the wavy type of petal case of Sweet Peas, but, personally, I ler a frilled edge of the petals gives a of large-flowering Gladioli a less formal more attractive appearance. This g of the petals is only just appearing Primulinus hybrids, but here its effect re marked, and I consider that when l Primulinus come on to the market ntity, they will eventually supersede the ry plain-petalled kinds.

is unnecessary for me to state that oli have rapidly become more popular s country of late, and without shadow ubt they are likely to become greater rites. Their claims to public favour are, , ease of culture, extraordinary beauty liversity of form and colouring, and adaptability and general usefulness both garden and for interior decorative work. own mind I consider the future of the olus—the extent to which it may become r—depends very largely on the capacity of the Primulinus hybrids for further development and improvement. What good qualities could be combined with the Gladiolus which it does not now possess, and which would tend to make it a still more valuable plant? In the first place, it is not hardy except under very favourable circumstances in the south, corms have to be lifted each season and protected from frost. It would be an advantage if we could leave them in their flowering positions for a period of 2 or 3 years in the same way that we leave our spring-flowering bulbs. There is at least one fairly hardy (perhaps quite hardy) species grown here which I know can be left in the soil throughout the winter. I do not know its name or whether it is a variety or a distinct species. It is fairly early flowering, purple in colour, and often met with in cottage gardens. Perhaps some hybridist may think it worth while to try to combine this hardy constitution with a larger, better flower. Then, again, the possibility of scented Gladioli is not too remote; some of the wild South African species are sweetly scented, the fragrance being usually most pronounced towards evening. I do not think it is too much to hope that one day raisers will give us varieties which possess this additional attraction.

In giving these possible and fairly obvious lines on which future development may conceivably take place, I have not overlooked the possibility that the daintiest of all the Primulinus hybrids may be superseded by a totally distinct type still more light and graceful. I am confident hybridists have not explored all the ground which can be covered as regards the wild South African species. Some of them have extremely thin, wiry stems, and for lightness are fully equal to Montbretias. In some cases their stems are not upright, and although many may disagree, I think that, given a thinner stem, a smaller flower and a fairly wide placement, a nice graceful bend in the upper part of the flower spike would not be inconsistent with greater value for light interior decorations; for instance, table decorations.

Hybridising Gladioli is work which can be undertaken by any amateur grower. The actual procedure by which crosses can be effected in Gladioli is extremely simple. Of course, the raising of the hybrids from seed is essential, but this presents few difficulties even to the veriest amateur. Results, without always being successful, are invariably interesting; indeed, fascinating. Space will not permit a full explanation of the procedure, but perhaps I may be allowed to give details in a future note.

The grey garden



Purple Dahlia Porthos

Potting Chrysanthemums

These are now making headway and must be shifted on into larger pots as this becomes necessary. A cool frame well protected from frost at night is an ideal structure for them at this period, and young plants taken straight from their rooting quarters will be found to do better in such frames than when placed on high-and-dry, airy shelves in greenhouses.

EASTER WEEK IN THE GARDEN

Southern and Midland

Indoor plants

From this date it will be found advisable to examine plants for water twice each day, as with the greater heat of the sun and increase in the amount of ventilation plants of a free-growing character which are developing flower-spikes dry out rapidly. If permitted to flag seriously they will be found lacking in quality when in bloom. All such plants not actually in flower will derive considerable benefit from applications of weak liquid-manure at this date, or an approved fertiliser, such as Peruvian guano, but on no account should feeding be overdone.

Perpetual Carnations

As these are developing successional flower-spikes it is evident that assistance in the matter of feeding is of the greatest importance. Whilst on this subject I would point out that any of the plants required for late summer flowering under glass should be potted on now. Young stock must not be permitted to become pot-bound at any time, but immediately the roots are found to be circling the soil they should be transferred to larger-sized pots.

Melons and Cucumbers

A brisk temperature must be maintained if these are to be successfully grown. Sixty-five degs. at night, with a rise of 20 degs. by day—with sun-heat—will prove satisfactory, abundant moisture being maintained by two daily syringings and damping of the floors. Carefully tie in the shoots, and Melons approaching the flowering stage should have such shoots pinched at the first joint beyond the fruit. Cucumbers must be stopped frequently in order that the Vines may be evenly furnished, but overcrowding of the shoots will lead to disaster.

Strawberries in pots

Immediately the flowering is over, these may be liberally fed until they show distinct signs of colouring, when clear water only should be given. Even at this date it will be advisable to hand-fertilise the flowers of successional batches, which must be introduced regularly from cooler houses in order to maintain an unbroken supply of ripe fruit. Ply the syringe freely amongst the plants when not in bloom, otherwise they are liable to disfigurement by Red Spider.

Pricking-off and potting-up seedlings

For both indoor and outdoor plants this now calls for daily attention and should always be taken in hand before the plants have become too drawn up and large. A very good guide is that of dealing with the plants when the third leaf is developed. Dealt with at this stage the little seedlings quickly take hold of the new soil. A very important point is that of the new soil, which should be brought to the same temperature as that which the seedlings were lifted from.

Propagating

Where large numbers of bedding plants are grown, propagating is a very heavy task at this season, and cuttings must be handled before they have exceeded 3 inches in length, and plunged in bottom heat. Almost any plant can be rooted at this season.

Potatoes

Everything should now be placed in readiness for the planting of the main crop of Potatoes. All old manure, Mushroom-bed, ashes, and partially decayed leaves should be mixed with a small quantity of superphosphate and carted to the plots the Potatoes are intended to occupy and then used at the bottom of each drill before the sets are placed thereon. Planting may commence without delay.

The kitchen garden seed bed

This must now be prepared with care. It must be made moderately firm, following which it should be raked and re-raked in order that the surface 1½ inches is of a clean and sand-like nature, as this is really the garden nursery, where Cauliflower, Cabbage, red and green Broccoli, Brussels Sprouts, Leeks, Savoys, Borecoles, Lettuce, etc., must now be sown and grown for supplying next winter's food. After sowing the seed in shallow drills protection by means of nets or other material from birds must be afforded.

Turnips

Early Snowball and other such may now be sown freely in the open, and plenty of air afforded to those growing on hotbeds during favourable occasions.

Winter Onions

These have suffered badly from the severe winter, but must now be planted out on well-prepared ground in rows 1 foot apart, the plants being 6 inches apart. The soil should work freely and be pressed firmly around their roots. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Rose pruning

Providing the weather is favourable a start may well be made next week with this important work. The hardier kinds should be taken first, leaving the pure T's till about the middle of April. Remove and burn all prunings at once, apply a fair dressing of some approved artificial fertiliser (I find Thomson's excellent), and then lightly fork over the surface of the beds.

The Perennial Borders

With the long spell of wintry weather, extending as it did into March, work of all kinds is sadly in arrears, so it is hardly likely that many growers have yet got the length of overhauling the herbaceous borders. It will now be well, however, to try and get this necessary work seen to, not only for the sake of tidiness, but also for the benefit of the plants. New borders may yet be planted, especially in the later districts and where the soil is of a heavy nature.

Sow Sweet Peas in the open

Those having no facilities for raising this popular annual in pots or boxes can grow as many as they want by sowing, within the next 10 days, on well-prepared ground where the plants are to bloom. Sow thinly in drills about 2 inches deep, and when the seedlings are well up remove any that may be overcrowding their fellows. These will be a week or two later in blooming than the early-raised plants, and will not grow to such a height, but they will furnish an abundance of fine flowers for cutting, and at the same time make a fine display in the garden.

Planting Gladioli

These, of course, may be planted at various times, but for general purposes the bulk of the varieties may now be got in if the soil is in good working condition. Deeply worked and liberally enriched ground is necessary if best results are to be looked for. Place a handful of clean, coarse sand under each corm. This will prevent excessive moisture lodging at the base, and a
same time will encourage the early p
tion of roots.

Attend to the lawns

Very soon, now, the mower mu
brought into use, so it is advisab
thoroughly sweep every inch of the
and then to roll them two or three
taking care not to do this when they ar
wet. Should there be any worn pa
now is a good time to repair them.
can also be pared, where such is nece
this being easier when the turf is wet.

Peas for succession

If a sowing was got in early in the
another should now be made in the
quarters so as to provide a succession
other. King Marrowfat and Webb's S
are ideal varieties for present sowing.

Broad Beans

Another sowing of these should also
in, for, like the Pea, this Bean is best
numerous sowings are made at interv
two or three weeks, thus ensuring
green pods over a long season.

Maincrop Celery

During the next 10 days or so is a
suitable time for the sowing of the
batch of this valuable vegetable. It
important that Celery never receives a
to growth from the moment it germ
until fit for the table, so every preca
should be taken to ensure that this is av
A genial, rather than a high, temper
gives excellent results.

Cucumbers

From now onwards a little shade will
fit these, while a warm and moist
sphere must always be maintained i
house or pit occupied by the plant
further sowing can now be made acc
to requirements.

Melon culture

Now that the days are of some lengt
the power of the sun considerably incr
it is much easier to maintain the nec
warmth in the Melon-house. Keep a
yet buoyant atmosphere, and see tha
plants never suffer from dryness at the
Tie and pinch as the necessity arises
prevent overcrowding.

Tomatoes

The earlier plants are now fit for
fruiting quarters, be that in pots, box
beds of prepared soil. In any case, se
the soil into which the plants are put
too cold, or a check may result. It is
to have it in the house for two or three
before consigning the plants thereto.
the plants must not be allowed to suffer
dryness it is necessary to see that the
not soured by over-watering.

Pricking-off seedlings

This is work that demands a good d
attention during the next few weeks.
all possible have it attended to as soon
various kinds become fit to handle, for
lings that are permitted to get drawn
lanky seldom do much good afterwards.

Half-hardy annuals to sow now

Not infrequently 10-week Stocks,
golds, Dimorphotheca, and Nasturtium
spoiled by being sown too early, the
getting starved in the boxes. All the
sown next week, should be in good ord
planting out early in June. The Nem
also, is still in time if sown now.

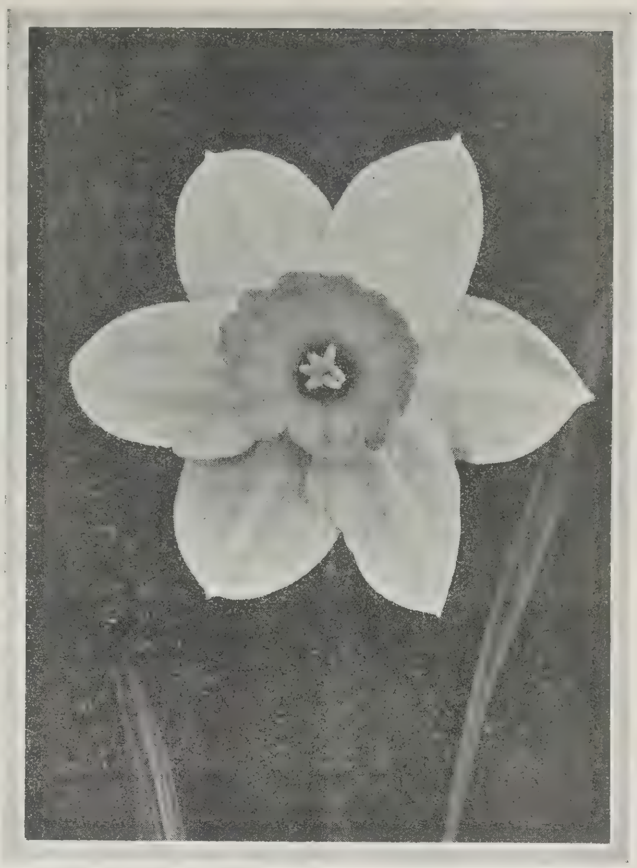
First Class Certificate, 1924. Raised by W. T. Ware



Basra
A fine smooth flower raised from Fortune

The Evolution of the Daffodil Over Half a Century—II.

By ALBERT F. CALVERT, F.C.S., Author of "Daffodil-growing for Pleasure and Profit"

(Continued from page 186)

MPING to 1929, let us observe how ings have developed, and examine the t kindly given me by Mr. George Monro ng, in his opinion, the best varieties for market, and garden purposes. The ies mentioned are, of course, in culti- in bulk in this country, and represent opinion upon available material, but hybridists are never idle many good are existing in embryo, among which rtune and Godolphin, "two of the best istence in course of time," *vide* Mr. o, whose list is as follows :—

Spur

Maximus
ns
White
s
Smith
Lisse

Princeps
Firetail
Barrii Conspicuus
Brilliancy
Horace
King Alfred
Ornatus
Sir Watkin

Snow King
Sunrise
Emperor
Obvallaris
Pheasant Eye
Sarchedon
Flame

vill be seen that all the above are typical lass market varieties of known quan- n the markets of Great Britain as befits lection of one with Mr. Monro's great ractical interests. Of the list, Firetail, us, Ornatus, Maximus, Flame, Sun- and Horace are comparatively new; have only within recent years been de- d in sufficient numbers for the bloom to arketed in bulk. One can the better ciate the improvement of the modern ls when boxes of the flowers are seen by side in the market in bulk—*e.g.*, us and Ornatus Maximus, King Alfred mperor, or King Alfred and Maximus. urse, Flame, Sunrise, Firetail, Horace, rœsus are distinctive and eminently t flowers, due to almost startling con- s between petal and "eye."

haps, after all, "The Poet's Narciss" is the most unchanged of all the types; it is, as Mr. Wilson says, "As old-fashioned as Homer, but as unstaled and fresh." The fine forms which have been evolved during the last three decades, adequately represented by Horace and Raeburn, are not so far removed from their prototypes as are many recent Narcissi in other sections. They are still flowers of pure race.

No one need retain, nor would wish to, the varieties of Poeticus favoured 50 years ago. In this respect the "painting of the Lily" has been successful. The hybridist has left the essentials of the flower unchanged, but has certainly accentuated its outstanding points—he has succeeded in making the already beautiful more beautiful still. In modern hybrids the disc is larger, the substance of the petal firmer, the Iris more vivid and varied, and the *tout ensemble* is bolder, stronger, has more colour, and yet retains its native dignity. In many, if not all of Mr. P. D. Williams' hybrids, we find these natural features sharply enhanced; it is as though one took a flower grown as in Nature, unsheltered and uncared for, and, by skilled attention and manipulation under a master hand, caused all its gaucheries, its crudenesses, its immaturity to drop away, revealing its vast potentialities, its highly-bred daintiness, and warmth of colour.

It was in the nineties that many new things came out, and Mr. Engleheart brought out the first batch of his remarkable Poets. The finest of these was undoubtedly Horace, which has become one of the most widely-spread marketable flowers. Mr. P. D. Williams, who saw the flower in its nursery status in 1895, says: "When I look back on the very short row of plants I saw growing with Mr. Engleheart, near Appleshaw, about 1895, and compare them with the millions now scattered over the world, I realise something of the potential value of a first-class Narcissus," and in a letter I received from Mr. Engleheart himself referring to Horace he says: "I am always beset with a sense of astonishment in remembering so clearly the morning when I saw its first bud opening on its first bulb. There must be now many millions of it in cultivation, and in the trade its bulbs are sold by the ton." Other now well-known sorts that came out about this time were Chaucer, Herrick, Homer, and Cassandra, and of these, Cassandra has become, probably, the best known from a commercial and wholesale grower's point of view, but from Chaucer Mr. Williams bred Macebearer, which is now coming along in fair numbers. In 1897 and 1898 still other varieties now in general commerce were launched, among them White Lady and Lady Margaret Boscawen, raised by Mr. Engleheart. White Lady particularly has done very well, and many millions of this bulb must now be in general cultivation. It is a very good "doer"; given good cultural treatment and somewhat shallow planting it will multiply at a remarkable rate.

I suppose that the greatest surprise of the epoch was the introduction of King Alfred by the little-known Mr. Kendall. Undoubtedly King Alfred is one of the best all-round commercial trumpets of the day, even now, and though it is notoriously prone to rapid and prolific increase, the variety still holds its own in the matter of price. For some years round about 1920 it cost 500s. per thousand bulbs, and in 1901, when the flower was first introduced, 100 bulbs were sold at 5 guineas each. Weardale Perfection, which was raised by Backhouse and was certificated in 1894, proved a grand parent both as seed and pollen bearer. The best results obtained from Weardale Perfection were a batch of seedlings raised by the late Mrs. R. O. Backhouse, which were known as the Lord Kitchener group. The cross was a flower of the Minnie Hume type with Weardale Perfection, and the result was, among others, this Lord Kitchener group, Moonbeam, Ethelbert, Sunrise, and many large coloured Incomparabilis, including Galopin.

(To be continued.)

New book on Daffodils

MESSRS. DULAU AND CO., LTD., are about to publish a book at one guinea entitled "Daffodil Growing for Pleasure and Profit," by Albert F. Calvert, F.C.S., with over 400 pages and 236 full-page illustrations, an Introduction by the Rev. G. H. Engleheart, M.A., V.M.H., and many special articles by Daffodil experts and enthusiasts.

The title of this work is an indication of the author's desire to be of practical service to the grower of the Daffodil who is ambitious to obtain the best possible results and feels, at the same time, that he is entitled to some material reward for his labours.

The work involved in the cultivation of flowers exercises a fascination which is its own requital, but it is only just that those who devote themselves to the improvement and multiplication of the species should be put in the way of gaining a profit for their pains.

Mr. Calvert, therefore, has endeavoured to combine particular instruction as to the stocking of the garden and the grading, planting, and rearing of bulbs with equally pertinent information pertaining to the picking, packing, and marketing of the crop.

He regards the chapters which treat of the money-making side of the subject as equal in importance with those that deal with the raising of the blooms, and if the grower thereby finds the surplus of gain is in excess of his immediate requirements the author bids him give thanks for the increase.

Mr. Calvert has had the invaluable cooperation of many of the most eminent authorities on the Daffodil who have supplied him with articles on various phases of the subject and have amplified his efforts with illustrations from their collections.

Special articles included in this book have been written by the Rev. G. H. Engleheart, M.A., V.M.H., P. D. Williams, V.M.H., The Brodie of Brodie, Guy L. Wilson, F. Herbert Chapman, W. E. H. Hodson, A. Beaumont, Alex. M. Wilson, A. Wilson, M.A., F. A. Secrett, F.L.S., H. W. Abbiss, E. B. Champernowne, Peter R. Barr, H. C. Longford, George Monro, and S. P. Wells.

In his Preface the author says that the responsibility for the compilation of this book was assumed at the request of a number of his Daffodil friends who, it is no breach of confidence to add, had failed to persuade the Rev. G. H. Engleheart, the greatest living authority on the subject, to undertake the work, and only then after he had tried, without success, to get him to alter his decision. Mr. Engleheart's refusal, he says, is much to be regretted, but as a concession to his persistence he consented to write an Introduction to his book and to contribute an article on the species, for both of which he acknowledges his deep indebtedness.

Mr. Calvert specially refers to the great assistance he has received from Mr. P. D. Williams and The Brodie of Brodie, two of the most successful raisers in the world, and he says he will always remember with gratitude the extreme generosity with which they placed at his disposal the benefit of their expert knowledge and wide experience, but he says kindly interest and desire to help has been, in his experience, characteristic of everyone connected with Daffodil-growing. He concludes his Preface by saying: "It is not too much to say that, although
experimental work has multiplied and b
fied the varieties of the Daffodil beyon
wildest imaginings of the ancient cultiv
it is to their patience and persistence we
the seeds of knowledge from which we
raise the flower, that we are reaping t
the harvest they sowed with an infinitu
loving care."

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plan
be named should send fair examples of each
stem, leaf, flower, or fruit. (Snippets of l
and points of shoots are useless.) Not more
four plants should be sent in any one week b
same correspondent. Where more than one
is sent they should be numbered. Of conifer
cones should always be sent.*

Naming fruit—*Several specimens in diff
stages of colour and size of the same kind gr
assist in its determination. Single, unripe
deformed specimens are difficult to name.
do not undertake to name more than
varieties at one time.*

TREES AND SHRUBS

Shrubs for small garden

(Amateur).—There does not appear to be any reason why trees and shrubs should not succeed in your rather clayey soil, provided that, at the time of planting, some light, rich soil be worked in among the roots of the plants. In order that you may make your own selection a list is given of 20 good shrubs with the approximate height of each:—Berberis Darwini (6 feet), May; B. stenophylla (6 feet), May; Weigela rosea (5 feet), May-June; Cytisus Andreanus (6 feet), April-May; Deutzia crenata fl.-pl. (6 feet), June; Hamamelis arborea (8 feet), January-February; Hydrangea paniculata grandiflora (4 feet to 5 feet), August; Magnolia stellata (3 feet), April; Philadelphus Lemoinei (4 feet), June; Rhus Cotinus (5 feet), July; Rubus deliciosus (4 feet), May; Spiræa arguta (4 feet), April; S. Anthony Waterer (2 feet), May-June; Kalmia latifolia (2 feet to 3 feet), May; Pæony Moutan (4 feet to 6 feet), April-May; Viburnum plicatum (5 feet), May; Ribes sanguineum (3 feet to 6 feet), April; Mahonia Aquifolium (3 feet), April-May; the Flowering Cherries and the Flowering Almonds, both spring-blooming. For trees there is an equally wide choice. If deciduous varieties be preferred, Maples and Copper Beeches, as well as the Scarlet Oak, are suggested, while among evergreens Hollies, Lawson's Cypress, Cryptomeria elegans, C. japonica, the Golden Yew, or any of the more moderate-growing Pines would be found alike suitable and ornamental in a small garden. Immediate planting is advised. If this cannot be done the work ought to stand over until September. As to the distance at which planting should be done, a safe rule in the case of shrubs is to follow the height of the specimens, *i.e.*, if a variety be 6 feet in height put out the plants 6 feet apart, and so on. In the case of trees, 12 feet to 15 feet is the accepted distance, but if a present effect be desired they must, of course, be planted more thickly and thinned out as they increase in stature.

Evergreen flowering hedge

(Amateur, Bridgnorth).—Nothing fulfils the needful requirements better than Berberis Darwini, which is, at all seasons, attractive. Plant now, preparing the site of the hedge in a thorough manner by incorporating a good dressing of rough leaf-mould, or, failing that, of well-decayed manure with the existing soil. Plant at a distance of 2½ feet and, preferably, in a single line. After planting, it would be well to mulch the plants with
to conserve moisture, and if, after pla
the weather is dry, watering occasi
until the plants are established is r
mended.

Plant for name and treatment

(Miss A. Donovan).—This appears
the Portuguese Crowberry (Corema
which much resembles our native Crow
(Empetrum nigrum). It should be
hardy with you, as it flourishes in
sandy peat around London, and is val
as being a neat, if not showy, little everg
It may be increased by cuttings taken d
July and August, after the manner of He
dibbled into pots filled with sandy peat
placed in slight bottom heat with a bell-
over them.

Shrubs for greenhouse

(Greenhouse).—Six good shrubs fo
purpose indicated might be selected fro
following:—Deutzias of sorts, C
racemosus, Hydrangea paniculata, Li
floribunda, Lilacs in variety, Azaleas of
kinds, Rhododendron Pink Pearl, Spiræ
sorts, and certainly S. confusa, an
Guelder Roses.

GREENHOUSE

Span-roofed greenhouse

(M. L. M. Vaudin). — (1) Came
Oranges, half-hardy Rhododend
Coprosma Baueri variegata, and som
the half-hardy Euonymuses would be
to succeed. (2) Lapageria, Ivy-leaved
goniums, and Passiflora cærulea. (3)
green Rose (Rosa sempervirens Var. Fel
et-Perpetue).

A small stove house

("Hopeful").—It is practically impo
to successfully grow all the plants you
in one house. Melons, in particular, c
possibly do any good under the condi
mentioned. As Cucumbers benefit by a
shade they would, to a certain extent,
ceed, along with the Ferns and Begonia
house with an eastern exposure is not
suitable for Melon culture, even if devot
that alone. The only thing we can su
as likely to help a little is to arrang
Ferns and Begonias on the staging o
west side and then arrange a light bli
hang from the roof—inside, of course
this would afford the requisite shade
at the same time admitting all the avai
sun to the Melons. A blind made of ti
and constructed so as to be easily rolle

do nicely, and could be pulled up in ernoon when the sun got round. This, rse, is merely a makeshift and cannot re than slightly modify the bad condi- nentioned.

ea Ecklonis (Baker)

M. H.).—This is an Iridaceous plant Cape Colony, South Africa, and has ished itself in parts of California from wn seeds. In general appearance it e likened to some of the Sisyrinchiums, it is not hardy in England you would ut few buyers for it, especially as it is owy enough for greenhouse cultivation. best way to find buyers for it would be ertise the seedlings you have to spare ARDENING ILLUSTRATED, among whose circle of readers you would be most to meet with buyers. The value would at of an unusual but not outstanding say, 1s. each. If you had seedlings to of Aristea fruticosa, which grows like a shrub with the branches ending in tiny Iris-like leaves with pretty panicles e flowers, you would have a more pro- proposition than with the species you on hand.

althy Palm

H.).—Your Palm is suffering from a ggravated attack of White Scale, and t, therefore, be healthy. The Scale be easily removed by syringing the first with tepid water and after- by sponging the leaves and stems with y strong solution of soft-soap dissolved ter at a temperature of 65 degs. to 70 After sponging, again syringe with soft water. The case is a bad one, and be necessary to repeat the treatment n interval of 10 days. Afterwards the ought to be kept under observation so cipient outbreaks may be dealt with in ly stage.

s for moraine on greenhouse stage

inist).—The conditions would appear to re than ordinarily artificial, and only which are naturally of rather an ac- odating nature would be likely to give ction. A selection made from the fol- would, under average conditions, be st fairly satisfactory. Arenaria pur- ens, Cotyledon oppositifolia, Erinus rs, Gentiana lagodechiana, a selection ine Phloxes, including P. G. F. Wilson, P. subulata x amœna, Phyteuma ri, Saxifraga decipiens superba, and S. don, as well as any favourites of the , Synthyris reniformis, many of the s, Armeria Laucheana, Æthionema stum, Hypericum fragile, and alodes cappadocica. Raoulia australis, a alpina, and Linaria pallida, too, be worth a place.

FLOWER GARDEN

sed Hyacinth

W. W.).—Your specimen bulb is d with a soft rot disease, which in this as been caused by bacteria. It is some- difficult, from the evidence we have, to how the attack commenced, but it more than likely that the disease was t when the bulb was purchased. If as the case the bulb became affected last season, and when it was planted me in the fibre the bacteria increased and killed the bulb before it could flowering stage. The bacteria may got into the bulb since it has been in are, but we hardly think this likely. hould burn any others that are affected, r with the fibre in which the diseased re growing.

Bateman).—Your Hyacinth has been d with the same trouble as given above, but death did not occur until later. We are afraid that there is no remedy.

Yellow Nemophila

(O. M. Pudor).—We think there can be very little doubt that your plant is Limnanthes Douglasii (Floerkea Douglasii), and not a Nemophila at all. There certainly is not a yellow-flowered Nemophila known to science, and as the Limnanthes is rather similar to the Nemophila insignis in leaf and in habit your mistake is not very surprising, although the two plants belong to two entirely different Natural Orders. The Limnanthes is well known as a hardy annual and cultivated as an edging plant or in quantity for bees. It is a native of California and Oregon.

VEGETABLES

Surplus produce from kitchen garden

(E. D.).—Inquirer should make arrangements to send his produce to Covent Garden and/or other markets, so that he may clear all he has to offer. This will entail two or three necessary provisions. First, he must decide what marketable crops he can grow, first taking advice on this point. Then he must get into touch with one reliable commission agent in each market he wants to supply; and thirdly, must ascertain and abide by market methods of grading and packing. He gives us no idea as to what part of the country his estate is, nor its capacity—its position as to railway or other easily reached depôt for dispatch. Without knowing something of these our advice can only be on general lines, whereas we could be of more help to him if we knew more. We would, however, impress upon him the importance of starting on right lines, as it is so easy to get wrong and expensive to get back.

Cultivation of Mercury

(L. S.).—Mercury (" Good King Henry ") is an admirable substitute for Spinach, and its leaves are used in the same way as those of the latter. Perennial in habit, Mercury must be planted on deep, cool soil which has been well enriched by the addition of manure. A bed well treated will remain in profit over a series of years. " Good King Henry " was, and may still be, grown largely in certain parts of Lincolnshire for market purposes, and the produce finds a ready sale in spring.

FRUIT

Loganberries and Raspberries

(B. N. Hurtmore).—Trench your light soil to a depth of at least 2 feet and enrich with good farmyard manure, cow manure for preference. This should be thoroughly incorporated with the soil, not placed in layers as is too often done. Chicken manure is very useful, but should be seasoned in a dry shed before using. It may then be dug into the ground during its preparation or applied as a top-dressing during the growing season. Wakeley's manure is a very useful substitute when farmyard manure is not available, and is now used extensively on all crops. Bone-meal is excellent, too. Mulching should be applied at the end of April, as Raspberries resent dryness at the root. We would point out that in making new plantations of either of the above the canes should be cut down to within 1 foot of the ground to induce the plants to form suckers for the following year's crop. This should be carried out before mid-April. The following are among the best varieties for your class of soil:—Summer varieties: Perfection, Superlative, Profusion, The Devon, Hornet, and Herbert. Perpetual or autumn-fruiting varieties of excellent quality are: Perpetuelle d'Billard, Yellow Superlative, Surprise of Autumne, Ameloire d'Congy, and November Abundance. Plenty of feeding will be essential for the production of good Loganberries and heavy mulching.

Apple twigs

(Orchard).—The twig sent in has present eggs of two kinds. The round red eggs are those of Red Spider, while the long white eggs are those of Apple Sucker. You do not state what spray fluid you have used. If it was a tar oil wash it should kill the majority of the Apple Sucker, but would have no control over the eggs of Red Spider, and you will find that these will hatch out in due course. If the trees received a good, thick limewash just as the buds begin to burst you would be able to seal in most of the eggs. After Red Spider eggs have hatched, the best control is sulphur in some form. A convenient form is potassium sulphide. If the Apple Sucker becomes troublesome spray with a good nicotine wash shortly before the blossoms open.

Apple bark splitting

I notice that even quite large branches are showing fresh, straight splits as though cut with a knife. The soil is chalky and the trees, which have borne very good crops for the last two seasons, I believe, have been planted for about 15 years. B. E. W.

[We do not think that the bark of your Apple trees splitting and healing up like it has done in the specimen sent for examination need cause you any worry. Apple bark often splits like this, and the actual cause is, in many cases, obscure. A very common cause is that caustic washes have been applied several years in succession and the bark becomes hard. When thickening of the stem takes place the bark, instead of expanding naturally, suddenly gives way under the pressure set up, and the long cracks appear. Gardeners of the older schools, if they found trees in this " hidebound " condition, frequently took a pruning-knife and made a longitudinal cut down the main stem. The work was done during summer, and those that carried out the operation maintained that the trees so treated fruited better during the next few years. We are of the opinion that if Apple bark splits during the actual growing season no harm results, because the open wounds soon heal up. If, however, the splits occur in the dormant period from the effect of hard frost such wounds would remain open wounds until the following early summer and fungus spores are liable to enter the tree. This could be largely prevented by filling up the cracks with grafting-wax.]

Mildew in Vines

(Caradoc).—Mildew is caused either by a close, stagnant atmosphere or by draughts. You will be able to decide which is responsible. If the fungus persists heat the pipes of the vinery until they are fairly hot—not merely warm—mix some flowers of sulphur to a paste with water, and paint the pipes with the mixture. Or the affected leaves may be dusted with flowers of sulphur in a dry state, repeating the dusting until the fungus disappears. As to your second query, the Plum trees ought to be very thoroughly sprayed with cold water applied by means of a hose or of a garden engine—failing either, by a syringe. Cold water forcibly applied in the early stages of an attack is effective.

LEGAL POINT

Wages during illness

(Gardener in Doubt).—You are entitled to claim the whole of your wages whilst you are absent through illness, and your employer has no right to deduct any portion of the wages because you are a member of a sick club.

NAMES OF PLANTS

E. F. C.—Impatiens Sultani (Sultan of Zanzibar's).

A. D. C.—Buddleias to name. Further reply. 1, B. Fallowiana, silver foliage serrated, branched terminal inflorescence; 3, B. auriculata, sweet-scented flowers, green leaf with silver underside. The Sarcococca is S. ruscifolia.

LATE NOTES

Portsmouth Flower Show

Portsmouth Horticultural Society have arranged an exceptionally fine summer show to be held on Southsea Common on July 24th, 25th, and 26th. First-class prizes are offered both in the open classes and in the amateur's section. The show should attract a great deal of interest, and secure big entries.

Shrewsbury Floral Fete

The great Shrewsbury Show will be held in the beautiful grounds of the Quarry on August 21st and 22nd. No less than £1,550 are being offered in cash prizes, and the schedule includes some extremely valuable trophies and medals.

NEWS IN ADVERTISEMENTS

Green's mowers

The lawn mowers shown this year by Thomas Green and Son, Ltd., of Leeds, include the well-known "Supreme," which is ideal for all-round handwork. This model now re-appears with an enclosed gear-case, besides self-aligning and dust-proof ball bearings and a simple device for adjusting the cut without the need of a spanner. Other models are the De Luxe "Silens Messor" for finest cutting and the "New Century" (side wheel machine), whilst in the heavy class, Green's motor mowers and triple and quintuple horse or tractor drawn mowers, have special merits. Green's also specialise in rollers, lawn markers, verge cutters, all of which are illustrated and described in their catalogue No. 23.

Slug destructor

The Slug Mort Company, as their name implies, manufacture a preparation which ensures certain death to slugs and snails. A leaflet has been issued by the Company giving full particulars of the preparation.

"Acme" aids

"Acme" requisites for garden and orchard are included in a new catalogue just issued. Fertilisers and insecticides are the chief lines, but the Company manufacture a large number of first-class garden aids for which they have secured an excellent reputation during the last 40 years.

LATE REPLY

Propagating Feijoa Sellowiana

(Italia).—This handsome shrub is a native of South Brazil and Uruguay, and created a good deal of interest when introduced by Edouard Andre in 1898. It may be increased by cuttings made of the young shoots during early summer and placed in a close, warm frame, where they root freely. The fruits of the above are more or less egg-shaped and of a delicious aromatic, spicy flavour. The second tree to which you refer is, probably, that of Psidium pomiferum (Guava), which produces Apple-shaped fruits. Cuttings of young shoots getting a little firm at their base placed in sand under a bell-glass and in bottom heat will be found to root readily. You should watch your trees and secure the cuttings when they have reached the conditions given above, as growth in Italy would be in advance of that of this country and would have to be judged there.

The Jubilee Celebration Number

We take this opportunity of thanking readers from far and wide who by letter and telegram have sent congratulations to "Gardening Illustrated" on attaining its Jubilee. Our thanks are also due to willing contributors who helped to make the Jubilee Number a conspicuous success.

"Gardening Illustrated" Jubilee Dinner

To celebrate the Jubilee of GARDENING ILLUSTRATED Sir Ernest Benn gave a commemorative dinner on March 15th at the Hotel Cecil. The guests, numbering about 70, included the Editors and Managers of Benn Bros.' journals, representatives of Ernest Benn, Ltd., and the Trade Promotion Trust, and Directors of the firm. There were six toasts and no fewer than 11 speeches, without a single musical note between, yet the speaking was of so humorous and clever a character that there was not a dull moment in a 3½-hour programme. Sir Ernest at the close remarked that on that occasion they had deliberately omitted their "great orators" and limited the speakers to the younger end, only to find, to their surprise and delight, that Bouverie House was becoming "a perfect nest of orators."

In proposing the toast of "GARDENING ILLUSTRATED," Sir Ernest Benn said that the statistical department informed him that the combined ages of all the Benn journals was 533 years, and that figure also, curiously enough, represented the combined ages of their Editors and Editresses. (Laughter.) Five hundred and thirty-three years took them back to the year 1396, which might, therefore, be considered their birth year, and which he was authentically told marked the end of the Dark Ages, the beginning of the Renaissance, and the start of "such civilisation as we have amongst us." (Laughter.)

Referring to GARDENING ILLUSTRATED, he said that the founder and first Editor, Mr. William Robinson, was in his 92nd year, and so far he had only had two successors in the Editorial chair, their fine old Scottish friend, Thomson, who died a few years ago, and the present Editor, Mr. H. Cowley. Robinson founded the journal with the idea of raising the standard of gardening, just as his father, the late Sir John Benn, risked his all in starting the "Cabinet Maker" in 1880 to lead a revolt against the atrocities of Victorian furnishing. Sir Ernest concluded by congratulating those in charge of the paper on the maintenance of its traditions and wishing it equal success in the next half-century.

The toast was responded to by Mr. Herbert Cowley (Editor) and Mr. H. W. Duck (Manager), and then followed a series of toasts proposed and acknowledged by members of the staffs:—"Literature," proposed by Mr. H. B. Crole-Rees (Managing-Director), response by Capt. E. W. Gregory ("Cabinet Maker"); "The Art of Advertising," proposed by Mr. N. French ("Hardware Trade Journal"), response by Mr. E. H. Hallows ("The Gas World"); "The Firm," proposed by Mr. L. J. Moolenaar ("The Chemical Age"), response by Mr. John Benn ("Discovery").

In proposing the final toast of "The Chairman," Mr. Gordon Robbins remarked that as the health of Sir Ernest Benn was of the greatest importance to the firm it was appropriate to couple the toast with the name of the lady who did most to look after it. Lady Benn, who was very cordially received, acknowledged the toast in one of her happiest little speeches.

LAWNS Require Attention—NOW

NOW is the time to feed your lawns in preparation for the summer months. A reliable complete fertilizer will quickly create dense turf. Moss, clover, and weeds should be eradicated now by applying Fisons' Lawn Sand.

Fisons' Technical Bureau is maintained for the benefit of enquirers, without obligation.

FISONS' LAWN GUANO

(A Compound Fertilizer)

e safest dressing for turf. It feeds the turf over a long period and will not burn discolour the grass. Lawn Guano quickly strengthens the roots and encourages ense growth of fine grass. As used by important clubs and municipalities. Apply w at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**5/-**	**9/-**	**15/-**	**25/-**

FISONS' BASE FERTILIZER

ould be incorporated with the soil before sowing grass seed. Specially prepared promote strong root growth and give new grass a good start. Use 4 ozs. to the yd. a few days before sowing the seed.

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**4/6**	**7/6**	**12/6**	**20/-**

FISONS' LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and in so doing stimulating the grass. A thimbleful destroys a large weed, such as a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Measure and full instructions sent.

Prices, in Kegs :	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**5/-**	**9/-**	**16/-**	**27/6**

FISONS' GRASS SEEDS

are the finest procurable, being specially tested before selection.
Special Mixture (for Bowling and Golf Greens, finest grasses only).

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**15/6**	**30/-**	**58/-**	**110/-**	**210/-**

McHATTIE'S *of* CHESTER

THE VEGETABLE FAMINE

Owing to the severe frosts, gardens everywhere are absolutely denuded of vegetables, and a vegetable famine is with us. The same thing applies to flowers. Millions of Perennials and Biennials have been destroyed.

Ryders have prepared a brief, practical group of suggestions which are embodied in a pamphlet. This shows in simple language how gardening people should proceed now to remedy this disaster.

If you desire to have the pamphlet or catalogue, or both, whether you are a customer or not, please send postcard to-day, stating which you require, and we hope to be able to send you an answer by return.

Kindly mention this paper.

Ryders *and the* VEGETABLE FAMINE

Owing to the severe frosts, gardens everywhere are absolutely denuded of vegetables, and a vegetable famine is with us. The same thing applies to flowers. Millions of Perennials and Biennials have been destroyed.

Ryders have prepared a brief, practical group of suggestions which are embodied in a pamphlet. This shows in simple language how gardening people should proceed now to remedy this disaster. A copy is included in every order sent out.

Owing to the hard frost and the late season there is still plenty of time to sow your seeds. Order now from

If you desire to have the pamphlet or catalogue, or both, whether you are a customer or not, please send postcard to-day, stating which you require, and we will send same by return.

Kindly mention this paper.

An Easter Alleluia

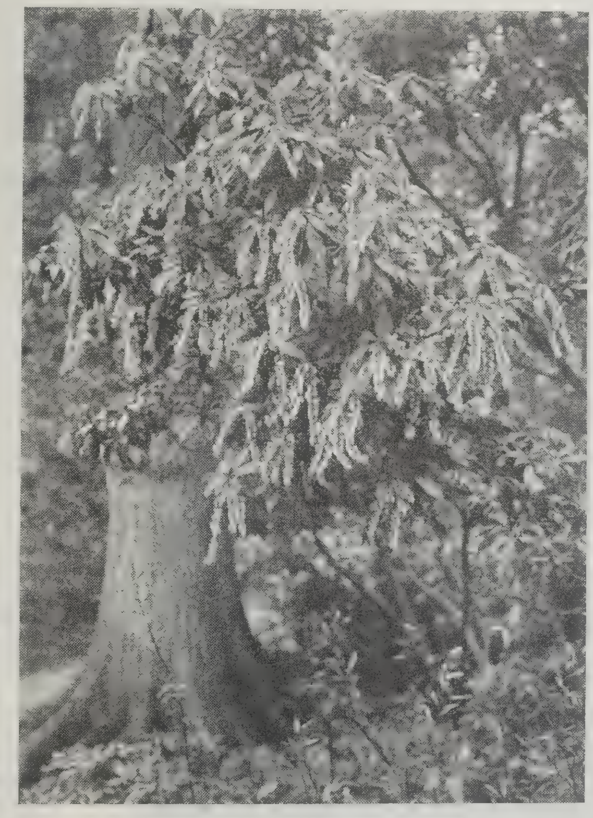
the time the Easter moon is at the ll we may fairly hope that the worst of wicked winter is behind us and that uel east wind, so long an unwelcome , will have given place to a soft ester, and healing showers come as to a wind-scarred and burnt earth. aster weather is seldom unkind, and if lays the game properly there will be und backward in following old Omar ám's advice, and

> "the Fire of Spring the winter
> garment of Repentance fling."

es not the delightful Jubilee num- f GARDENING ILLUSTRATED bring to us, with a real sense of rejoicing should be so, that we are a nation leners, amateurs and professionals, py band of brothers, and every ble hour of the holidays will be by man and woman in the garden work-a-day world claims us again lesday morning, refreshed both in and soul. The North countryman work planting Potatoes as early sible on Good Friday, and he will ll you that Peas and Broad Beans on that day will, without doubt, -eminent among the crops, and the part is that it usually is so!

pite of cutting winds and lengthy of cold the "green fire," as the y people call it, is slowly but surely ing over the land. Lilac buds are bursting, Weigelas are unfurling eaves, Viburnum Carlesii reveals sters of tight-packed buds in a set- new green leaves, and Forsythias urrying up both with leaf and as if to apologise for a late ap- ce. Everything is, indeed, quite eks behind the times, which is a blessing, for this very backward- has saved things from great r. And when we read of 26 degs. degs. of frost in parts, and think here must be many sore hearts ing the loss of countless garden es, we, in the far west, offer up heartfelt Alleluia that we have pared so much.

lodendrons, though the early kinds very late, show no signs of suffering. ecox is showing its delicate mauve in the dell. Andromedas, or Pieris, nda, Formosa, and Japonica are in purity of bloom, not in the least d by cold, as too often befalls these shrubs. Spiræa media is starred with Nuttallia has at last opened its -scented sprays. So long has it re- in bud that I was afraid it was going a miss this year. Erica arborea is fragrant masses of flower in the breeze, grown now into great bushes 5 feet high and as much across, dearly beloved of the bees. Hyacinths have come up remarkably free from slugs' unwelcome attentions, and, in all the panoply of Oxford-blue, are perfuming the terrace under my windows. Why is it that pink and mauve Hyacinths are always later to colour than the blues? I have noticed it is nearly always the fact. The dear old Polyanthus, Hose-in-hose, is winking a cheerful eye at the sun, and the double mauve, white, and yellow Primroses are luxuriating amongst their commoner brethren of the woods. Stems are noticeably short this year, due, I suppose, to the dry period that has prevailed during growing time. Primula Kewensis, I *think*, has survived, though I feared greatly for it a month ago. Pittosporums have suffered badly, especially nigrescens, and will have to be judiciously trimmed, and the leaves of several Eucalyptus are shrivelled and burnt. Once a Eucalyptus can be got past its childhood stage it can take care of itself very well, but it is a troublesome infant to rear.



Pieris japonica in the woodland
Note the pendulous white racemes of this beautiful shrub

But the glory of the garden in another week will be the Daffodils. Each day sees an increase in the golden light that is spreading over the grass where thousands of spearheads are bursting their coverings. Sir Watkin, Butter and Eggs, Eggs and Bacon, Silver Argent, Emperor, and others will be in full beauty to greet the Easter morn, but only just in time to act up to their reputation as "Daffodils that come before the swallow dares, and take the winds of March with beauty." Already numerous prophets have notified the papers of the inevitable slogan, the voice of the cuckoo has been heard in the land! So now we know that spring is at hand. There is no disputing, however, the fact that the volume of bird-song is a daily crescendo, one and all eager to proclaim that the winter of their discontent is past; all their ritual must be said. Are they not rendering to perfection the song from "Pippa Passes":—

> "The year's at the spring and day's at the morn,
> Morning's at seven,
> God's in His heaven—
> All's right with the world."

E. D.

Botanising in the Himalayas

Mr. R. A. Cooper gave an interesting address on "Botanising in the Himalayas" before the members of the Horticultural Club on March 12th, when Mr. P. R. Barr presided over a representative gathering. The lecturer dealt chiefly with Bhutan, a native State to the east of Sikkim, the home of Rhododendrons that Hooker introduced to this country. The country is made up of a series of valleys running south from the main range of the Himalayas. Mr. Cooper is the only man who has botanised this particular region since the time of Griffiths and Booth. He followed Griffiths' way in from Buxa Duars in Bengal. The lecture was illustrated by a series of splendid lantern slides, and in some of the views the presence of Pinus excelsa and P. longifolia was noticeable. Among the plants recorded was one of the Plumbago family, Ceratosigma Griffithii.

Pictures were shown of Rhododendrons at home in secluded recesses. The species included R. campylocarpum, R. Hodgsonii, R. campanulatum, and R. cinnabarinum. One picture showed a hill-top at 13,000 feet, where Primulas of the Capitate type and bushes of Rhododendron lepidotum and R. anthopogon were growing. The latter is ground up and used in incense sticks.

Perhaps the most interesting slide of all was one showing natives carrying huge bundles of Eremurus stems. These stems were brought in for fuel in a district where woody plants are scarce. The species used for fuel is the tall and exquisite Eremurus himalaicus, so highly cherished in our gardens.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Birds in the garden

As a confirmed bird-feeder on a somewhat lavish scale may I add my contribution to the correspondence that has appeared on this subject in your columns, and describe how I minister to the wild birds' winter and spring needs, much (as I firmly believe) to the benefit of the garden?

We have two roofed bird-tables, the shafts of which are fixed into large tubs that stand in front of the loggia and are kept filled with spring or summer bedding plants in succession.

On these tables, according to the severity of the weather, or, later on, the number of young broods requiring food, is spread a liberal provision of biscuit-meal or hound-meal, either of which provides the meat so necessary for the lives of the song thrushes, blackbirds, etc. No cooking is required, boiling water being merely poured over a large pan of the meal, in sufficient quantity to swell and soften it to the proper (not sloppy) consistency. After a few minutes' standing it is cool enough for consumption. This forms the staple of the birds' diet, but the following additions make it more sustaining and attractive:—Chopped fat, obtainable for a few pence from the butcher's; scalded Currants, which are also cheap and are greatly appreciated by the soft-billed birds; and lastly, if obtainable, some "damaged" cheese from the grocer, and the bird-provider can rest assured that his or her song-birds are being properly catered for. This feeding is prolonged over the breeding season, v
especially in dry weather, the birds are
sore put to it to provide for their broods.

Forsythia under a sunny window

"Hurrying up with both leaf and flower as if to apologise for a late appearance"
—An Easter Alleluia

Then for the hard-billed birds, the
hatches and the tits, five kinds of v
latter tribe avail themselves of our h
tality (the great tit, the blue, cole, m
and long-tailed), there are Cocoanuts,
six halves at a time; Mapleton's nutter-
which appears to attract the long-tailed
Monkey-nuts, and last, but not least,
of the indispensable bottles and hoppers
with Hemp-seed, to and from which an
less stream of tits, nuthatches, greenfin
chaffinches, hedge warblers, and, alas!
sparrows pass from daylight until dusk

Besides food, three bathing and dri
places are provided, and these furnish a
stant source of entertainment to the
lover. Also, both natural and artificial
ing places are abundant, while a deep
hedge, much old Ivy carefully fostere
walls, old stumps and the bases of tree
gether with a number of pyramidal
round-headed Bay trees, some still cli
others reverting to their natural state,
several Irish Yews provide safe shelte
winter roosting.

I have often watched with pleasur
settling in for the night of a surpris
large, mixed company of birds that
refuge in four of these Irish Yews sta
in the walled garden behind the house.

As may be concluded, the garden
orchard are full of birds. More tits tha
be counted on the fingers of both hand
be seen by anyone looking out of the
ing-room windows at any hour of the
But we suffer no loss from their depreda
Not a yellow Crocus amongst the hun
now in flower has been stripped, and
orchard's fruit-buds are undamaged.
last week the gardener, hearing of the w
sale destructions of fruit-buds by bullfi
in two neighbouring gardens, made a c
examination of our young trees, and
them, so he told me, all untouched.

In the summer some troublesome
slaughts are made on garden Peas, bu
this crime the gardener, after close watc
lays the blame, not on the tits, but o
house sparrows.

Bush fruits here are protected by a
enclosure, but this is left open until the
begin to colour, and no damage to Goose
or Currant buds has ever been suffered
fact, in one case alone we have to a
defeat in our friendly trial of wits wit
birds. To the blackbirds Figs seem to
irresistible attraction. They tear their
through protecting curtains of fish-nets
even contrive to eat the desired fruit th
the muslin bags into which they have
sewn. So we have to accept the situati
a cheerful spirit and feel that the frui
been generously paid for in song.

Here, in this garden, the charming
most destructive field vole is our chief e
Primroses and Polyanthus flowers
much from their attacks, the trails of ni
off flower-pips strewn through their
leaving no doubt as to the identity c
spoiler.

In the same way they nip throug
young growths of Columbines, garden F
and the central shoots of newly bedd
Snapdragons or Wallflowers, while S
spectabile, that delightful attractor of b
flies and bees, is destroyed year after ye
the same agency.

Seen at close quarters, however, the
is a lovely little creature, and since o
them became so far domesticated as to
the winter in a hole that he made for hi
in a sofa cushion in our glass-enclosed
balcony, looking out confidingly like a

from a kennel, killing them has become creasingly distasteful business, which is or the most part to the owls.

LEONORA L. YORKE SMITH.
ughfield Cottage, Sidmouth.

White Star Dahlia with white and yellow Snapdragons

Star Dahlias

was a good day for gardens when the utiful Star Dahlias were sent out from ssrs. Cheal's famous nursery. The , half-double flowers, so well thrown ove the foliage, are specially good when re combined with some other plants of rowth. We have those with white and flowers intergrouped with the white- Japanese Maize, and those with pink s planted with tall white Snapdragons nk and white Gladioli. They bloom so that a good proportion may well be for use as cut flowers, their long stalks ell-carried heads making them easy to ge in rather bold compositions. G. J.

Anchusa myosotidiflora

ve several clumps of this on the top of wall facing due S.W. It is a sunny, means wet, yet not excessively dry, n, and the soil is the staple existing gritty, gravelly loam. It is six or years since the plants were put in, and ave been left undisturbed, so that they pread to considerable size, even running e chinks of the upper part of the wall- . At no time have they exceeded 18 in height, with beautiful but by no coarse foliage, and profusion of bright lumes for quite three months, and f dead blooms are kept removed. Be- removing any wayward shoots from ity to other plants I have never inter- with it, and so satisfactory and beauti- been the effect that I am quite certain plant well worth retaining, that it is suitable for the position in which I , and that, grown under the conditions it represents very truly what might ly be expected of it. J. R. K.

Rock gardens at Chelsea

oks as if the rock bank at Chelsea this year will prove more conclusively ver the pathetic unoriginality of our "artists." The recent clamour for a new stone is sending the minions of Mercury scuttling about the country seeking an offering to appease the wrath of Apollo. Everybody is trying to be original because it is the fashion just now. Could better proof of uniform lack of inspiration be forthcoming?

The whole business is a rather amusing and wholly lamentable confession of artistic barrenness. Or is it gigantic egotism? Do these besotted "artists" really imagine that they have exhausted the possibilities of their material? Imagine a painter throwing aside his paints for crayon, pencil, or other medium because he had got the ultimate of expression out of paint.

Yet that is what they virtually claim. They have taken the finest stone obtainable for their purpose—what can possibly match the multi-shaped limestone? Compared with it sandstone, grit-stone, granite, are as crayon or carbon to paint. The same fluidity of expression is impossible of attainment. They have taken the best stone possible, and when they fail to get first-class effects with it they set up a grumble at the stone.

The truth is that there is a terrible amount of mediocrity in rock-building as in all art. There are to-day only two—at the most three—rock builders of the first rank. The others toil along in their wake, imitating, emulating. The sheep-like qualities of some of them are amazing. One artist builds a bold Alpine cliff at Chelsea. The following year cliffs are the order of the day. Another introduces stones of enormous size. Next year every builder has to use sheer-legs to lift his stones.

The artist of outstanding merit will achieve outstanding effects without changing his medium. The time spent in combing the mountains for a new stone would be more profitably occupied in studying effective rock formations and groupings. C. PENROSE.
Taplow.

Anemone Pulsatilla Mme. Van der Elst

I WONDER whether any readers would tell their experiences of Anemone Pulsatilla Mme. Van der Elst? Is it a real success anywhere? The type grows vigorously and seeds itself here, and is so beautiful that it is hard to believe it can be a British wild flower and not someone's find of honour in a far country. But the acid Van der Elst absolutely refuses, so far, to have anything at all to do with us. I have tried it over and over again, planted in spring in the open among the type, planted in autumn likewise, planted in pots in the cold house in autumn and again in spring. Still it dies on me, everywhere and at all times. The longest I have kept it is two months. Is this because it has been over-propagated? M. L. W.
Bath.

[Anemone Pulsatilla Mme. Van der Elst, unlike the stock from which it is a sport, is capricious in its tastes. This is not due to over-propagation, the plant is difficult by nature, and we know of other localities where it refuses to live. Although the parent is a native of chalk downs the offspring, A. P. Mme. Van der Elst, was raised and is propagated freely in the sandy peat of a Dutch nursery, and this may give us a hint as to its tastes. It should be planted in spring and, once established, should be left alone.]

Anemone Pulsatilla Mme. Van der Elst (the pink Pasque Flower)

The flower buds and young leaves are clothed in soft silky down

In praise of Primula Jewel

There are several patches in the rock garden that are now perfectly resplendent. After keeping up a brave effort of bloom all through the severe winter weather these patches now make a splash of rich violet, which, on closer investigation, proves to be Primula Jewel, the large, almost stemless blossoms starring the ground.

Jewel asks little and gives a great deal. These glorious patches are the result of a few plants being divided up in autumn and carelessly enough replanted. There are beautiful carmine shades, now obtainable in others also of the Juliæ type. Primula Crispi soon follows Jewel, but the colour, though good, does not harmonise with the various reds and blues now bursting into bloom. It requires to be judiciously placed. Jewel does not clash with these. With the golden Anemones and early Saxifrages, which mostly run through shades of yellow, the combination is perfect.

Personally, I feel very grateful for the advent of Jewel, and consider it indispensable to the rock garden. Everywhere it seems to give a good account of itself. The other day I was greeted joyfully by another garden lover with the words, "I have Jewel in full bloom in my rock garden." E. A.

Co. Tyrone.

Rare old garden plants

I have thought, lately, how wise the old growers were in their choice of good forms of perennials. For instance, 50 years ago most farm and cottage gardens in N.W. Cumberland at least contained Primula Arctotis alba, P. nivalis, not pubescens alba, a quite distinct and different plant, Erythronium dens canis major, with lovely rose-salmon flowers and brown and green leaves, a vastly better and larger form than any Dutch kind I have tried, a form of Monarda better than even the vaunted Cambridge Scarlet (this, though, seems quite lost), Amygdalus nanus, a much better form of the dwarf Russian Almond than the forms sent out from Petrograd just before the war, Saxifraga oppositifolia major, now sold as the type, and, as grandiflora, Saxifraga oppositifolia splendens, sometimes sent out as coccinea. This last, though of brilliant colour, was so delicate and spindly that I think it is quite lost again. The first two kinds I mention are by far the best of this family as garden plants. There are others I could mention, but these may be enough—at once. J. S.

Carlisle.

Tropæolum polyphyllum

I was somewhat amazed at the directions given by a correspondent in your paper as to the depth this plant ought to be put. Some 40 years ago I planted a dozen of the tubers on a half-shady rock bank in heavy clay soil thrown up against a wall from a trench cut for the foundations of some buildings. The stock are there now and are standing about a foot high, a condition they will be in for some time yet before the word is given to ramp away in preparation for the sumptuous flowering. I know the tubers of this lot will now be 2 feet and probably 3 feet down. On another bank we have Tropæolum polyphyllum Max Leichtlin's Variety, really a hybrid between Polyphyllum and Edule. This has smaller and deeper-coloured flowers, but is otherwise very similar. In endeavouring to find a tuber or two for Kew I pulled down a portion of a rock bank here and found several small tubers at the bottom some 3 feet down. The bank was then rebuilt, and I find the young shoots all through the ground again, proving that the main tubers had been still lower down.

I used to get the type in quantity from a Dutch grower at a moderate figure. When last I called I was shown a tiny patch of it, and was told that these were all the firm had left. In discussing the culture I was told that the firm cut up the tubers into pieces, planted them about 1 foot deep, and then placed flags over them, leaving narrow passages for the shoots to emerge. I only know of another stock of the smaller dark form, and that in the hands of one of the largest amateur growers in the country. He took me specially to show me this, saying that it was the only lot in existence. I was able to boast that I not only had it, but that my stock was larger than his. This form is not available anywhere. The type ought to be planted in early autumn before growth starts, and at least 18 inches deep, though probably it would be safer even deeper. If planted later the shoots are apt to get broken off, and this generally means death. I feel sure most failures in planting are due to this.

Kirkbridge, by Carlisle. J. STORMONTH.

Building a rock garden

Rock gardens are now very popular. Built now one might be one of the striking features in the garden from spring to autumn. It is the later built rock gardens that frequently disappoint. The soil has a chance to settle if the stones are placed in position at once and hollows and cavities as they appear can be filled in and everything packed firm before planting is commenced. This settling of the soil is an important part, for it is not merely a question of pushing stones a little way into the soil, but rather a matter of taking soil to the stones and packing it around them. No vacuum should exist beneath the surface of the soil or surface stones. The most usual fault in setting rock is that of so placing the stones that they seem to have no connection with the soil, instead of as the base of the rock garden, barely showing their upper ridges above the earth. The rocks should be placed neither bold upright nor dead level; let them slope in such a way that the soil cannot be washed over them, and each rock must slightly recede from the one below it. The surface of every part should be so arranged that all rain will be absorbed by it. Hence the objection of overhanging faces. Use rock of moderate size rather than a lot of small stones. The latter quickly become hidden, and if stones are not seen here and there the rock garden loses its most striking feature.

The rock garden should be made in full sunshine away from the drip of trees. It is best to avoid a general level. Therefore a hollow with its shallow banks sloping up easily to the natural floor of grass provides the most suitable location and, dying away to a natural level, will give a quite natural and informal look to the arrangement.

Many are deterred from this, thinking that Alpine plants are difficult to grow and require special soil. For all ordinary purposes any good garden soil will suffice if mingled with leaf soil and sand. This should constitute the upper 9 inches of soil; lower down, anything will do with plenty of stones to assure perfect drainage. Thorough drainage is essential, for although the majority of Alpine plants delight in plenty of water during the growing season they object to water hanging about them for any length of time.

I do not intend to give a list of plants, but I would like to warn would-be cultivators to avoid such plants as Aubrietia, Alyssum, etc., for they spread so quickly and their common qualities militate against them; rather try plants that only thrive under special conditions as regards exposure, drainage, and position. H. S.

EASTER PLANTING AND SO

At this season the thoughts of the gardener turn to the flowers of summer in which the glory of the garden finds its highest expression. If herbaceous plants are not already in their places no time should be lost in attending to their planting. There is time, but only just time, to plant herbaceous Phloxes, Michaelmas Daisies, Delphiniums, Pyrethrums, and Lupins. The planting of the popular flowers, Antirrhinums, Gladioli, and Dahlias, has been dealt with in recent issues. The late spring is favourable to April planting. At the same time it should be clear to all readers that no time must be lost in planting if we are to be rewarded in full with the flowers of summer and autumn.

Blank spaces in the rock garden

Planting Ramondias and Haberleas

With the approach of milder weather many enthusiasts will be filling up blank spaces in the rock garden, and amongst other plants some will be thinking of trying Haberleas and Ramondias. These are not difficult plants to grow, though failures sometimes occur because the subjects are wrongly placed. The ideal position is an almost vertical piece of rockwork facing practically due north. If there is a higher slope of the rock garden a little distance from the site selected, then so much the better, for it will serve to protect the Haberleas and Ramondias from the full force of the northerly winds. Thus, with their backs to the south, the plants will only be subjected to direct sunshine early in the morning and again at the latter part of the day. When inserting them in the crevices make sure that the roots are in contact with soil all the way round, and a label will be found to be an extremely useful article with which to ram in the soil. The most important point to remember is that rain should never be able to settle in the crowns, and even with young pot plants, which may be plunged in a frame during winter, it is advantageous to fix the pots on a slight tilt so that water dripping from the lights cannot fall into the centre of the plants.

Borders near the house well stocked with Fuchsias, Pelargoniums, Salvias, dwarf Lavender, and other delights of summer days

Ideas for summer bedding

Gone are the days when we of the old school of gardening had to rely principally upon Zonal Geraniums (Pelargonium), Calceolarias, Lobelia, and Ageratum for a floral display, backed up by coloured foliage, such as Iresine, Coleus, Mesembryanthemum, Pyrethrum, and a few others, all except the latter requiring more or less artificial heat and a deal of propagation from January onwards to get the requisite number necessary and duly hardened off by the end of May, causing much anxiety to those responsible for the supply, which used to run into thousands when carpet bedding was at its height.

Happily, things are now, and have been for some years, changed for the better, trusting to seedlings, also cuttings of plants of a much hardier nature by autumn or early spring propagation, Pentstemons and Antirrhinums in particular, while the ever useful Viola, in a wide range of colour, has almost changed beyond recognition within the last half-century. Consequently, we have a much more varied class of plants at our command, and bedding out, as we term it, has considerably altered for the better, the flat appearance of the majority of the beds giving place to elegance and lightness, which our forefathers never dreamt of, much less carried out. The bedding Geranium (Pelargonium) still has its merits, holding its own in many positions, but it is a monotonous outlook when one finds many beds in a design completely filled with these, with just an edging as a set-off. If such has to be used, say, in a fairly large bed, a few "dot" plants blending in colour should be introduced. That glowing crimson Paul Crampel as an undergrowth with the double Marguerite Mrs. Sanders form a good contrast, and the same may be claimed if a pink Geranium is used with a good yellow Antirrhinum towering above the groundwork. Antirrhinums are capital plants for filling either large or small beds, intermixing the taller-growing varieties with those of a dwarf habit. There is an endless choice of colour, easily raised from seed, and come as true to character as it is well nigh possible to get them, if from a reputed seedsman. They bloom early when sown in the autumn, flowering throughout the summer if prompt measures are taken in removing exhausted shoots and all seed-pods. Beds for these should not be too heavily manured. We learn this lesson when seeing how they flourish on quite stony soil, frequently growing, as well as flowering, on old stone walls or even on a bed of ashes. Another bedding plant that has come to the front of late years is the Pentstemon, producing large flowers of many colours, making a good display from July onwards, it may be treated similarly to the Antirrhinum, neither requiring much artificial heat; the cooler they are grown the better, an unheated frame or pit and the frost kept out suiting both admirably, whether cuttings or seedlings. Tuberous Begonias are showy, good wet weather plants, and look happy in small beds to themselves, or, if large beds are to be chosen, a few relief plants of the green, grassy-like foliage of Aralia or Fatsia japonica, while the fibrous-rooted varieties are useful for edgings, both requiring heat in the spring to bring them forward or their season is short. Calceolaria amplexicaulis and the ever favourite Heliotrope go well together, the latter as a base, the former trained neatly to stakes, and the flowering shoots allowed to depend. The former plant as a base and kept pegged with good-size plants of Heliotrope or Plumbago capensis always appealed to those responsible for the filling of good-sized beds.

Reverting to the Geranium, few beds are more effective than one or two of the Ivyleafs, Mme. Crousse and Galilee or Chas. Turner, each of which quickly fills their allotted space if pegged out once or twice and then allowed to run riot among a few branched twigs of Birch 18 inches in height, or the Calceolaria as dots placed 2 feet apart. Annuals that look well in a mass are Salpiglossis and Zinnias. The rich velvety colours of the former always attract attention, while the latter, especially the doubles, give us a variety of colouring which is somewhat difficult to define; both should be given a warm and sheltered position and be very neatly supported; both should be raised from seed in early spring, afforded a little heat if possible, and grown on without any check. The improved types of China Aster form attractive beds during late summer, especially Comet and Ostrich Feather, while the double Clarkias and newer Godetias, when given good quarters, find a host of admirers, and very charming are the many and varied colours.

Sowing annuals and biennials

Spring-time in the garden is essentially a time of preparation, and probably more sowing and planting will take place during the next few weeks than in the whole of the remaining year. Experienced readers have made their garden plans, deciding well in advance the various problems likely to present themselves.

It is not generally realised what a large number of flowers there are which are not only exquisitely beautiful, but also quite easy to grow. We name some which present no difficulties even to the beginner once their simple needs are grasped. We also give, briefly, the conditions of soil and situation most suitable for their successful cultivation.

When purchasing either flower-seeds or plants one should make a point of finding

IN THE FLOWER GARDEN

t, before planting them, when they will wer, their colour and height, the length of e they will be in bloom, and how long y may be expected to live in the normal y.

Hardy annuals

Ve hear the expression " hardy annual " lied to all sorts of things remote from ticulture, but most readers will know that ndicates the large group of plants which ture and completely die out within the npass of 12 months. This group repre ts the " short and gay " life in the floral rld. They need no greenhouse or garden me, and may be sown right out in the n from March till June for summer and umn flowering, and many of them again August and September for early spring oming. As a general rule they revel in an n, sunny situation unshaded by trees and ldings, and appreciate a well-cultivated . They should be sown very thinly in the itions where they are to flower, from ch to 2 inches deep, according to the size their seeds. Make the sowing when the und is in a nice friable condition; not too , but not wet and sticky. The main son why hardy annuals are not even more ular is due to the common tendency to rcrowd them. It takes a little bit of ral courage in the beginner, but it is essen to thin the plants out when they are quite , allowing each individual plant plenty of m. Very few annuals need less than ches " elbow room," yet, more often than , we see them left to grow just as they e come up, almost as thick as Mustard Cress.

ersonal taste has a very decided bearing the uses to which hardy annuals may be . Small beds in the lawn or elsewhere rely given up to a single variety or colour very charming. Most effective results obtained by sowing an entire bed with rich salmon or bright and glowing nge-scarlet Clarkias, the pale soft pink or ht rosy Larkspurs, and the many-hued dainty Shirley Poppies (both double and le). Again, the beds or borders may be le up of several kinds of annuals, nged according to their respective heights ny manner to conform to personal taste with due regard to colour-blending. It advisable to obtain separate varieties er than mixtures, then one knows exactly t colour to expect from each. Avoid nal arrangements, such as symmetrical s of each kind of flower running all along ll round a border. When in full bloom e are apt to look too much like steps on aircase. A more natural, artistic, and sing effect is gained by allowing the vari heights to slightly intermingle, at the e time preserving the general scheme of rf plants to the front and taller ones at back. Foliage plants, too, tend to lessen nality, and we like to see a plant or two and there of Kochia trichophila or Zea nica. The latter is, of course, simply a egated form of the common Maize, but it quite a Palm-like appearance. For ngs one may use the dwarf-growing sums (Carpet of Snow is excellent), Tom mb Nasturtiums, Virginia Stocks, or ophila, while clumps or little colonies of cetia, Candytuft, Lavatera, Linaria, ual Scabious, and Viscaria will fill in the tres. If one's soil is too hot and sandy most flowers, provided it is in a sunny tion the dwarf Nasturtiums and scholtzias will probably do really well. Nasturtiums, Convolvulus, and the yellow Canary Creeper (or Tropæolum canariense to give it its full title) may be depended upon to effectively cover an old tree-stump, unsightly fence, or trellis-work. Mignonette and Night-scented Stock—especially the latter—have a delightful fragrance; they are nothing to look at, but sow them in a bed near a window against which you sit in the warm summer evenings and their scent will be found most enjoyable. Tall Sunflowers and Sweet Peas provide us with an excellent means of screening ugly walls, fences, or outhouses. Sweet Peas may be sown in autumn or spring and strong, sturdy plants can be purchased reasonably from some of the noted specialists. We add a special word of praise for the "Queen of Annuals," for there is no other flower capable of affording greater results in proportion to the care and attention bestowed on it. It stands alone amongst annual flowers on account of its real usefulness and beauty in garden and home.

Circular bed of annuals and sundial

In the centre of the bed are tall plants of Tobacco (Nicotiana sylvestris), with long, pure white, sweetly scented flowers that expand by day as well as at evening

Phlox Drummondii

Of the comparatively large number of annuals suitable for cultivation in quantities for the decoration of the flower garden during the summer season, few can equal in brilliancy of colour the numerous varieties of Drummond's Phlox. Free in growth and profuse in flowering, they form most effective groups in the mixed border and in beds occupying favourable positions. They produce a display of surpassing richness. Probably the large-flowered section P. D. grandiflora is one of the most generally grown of the annuals and it is a splendid bedding plant. Its flowers are perfect in form, have a wide range of colours and remain a long period in beauty, thus enabling one to use them with great advantage in colour-scheme planting. To have the annual Phloxes in flower early in the summer, seed should be sown in March or early April in a genial temperature. Immediately the seedlings are large enough to handle they should be either potted into small pots or pricked off into boxes. Considerable advantages accrue from the use of large 60 pots, if space can be afforded, as not only is overcrowding effectively avoided, but the final transference of the plants to their flowering quarters is facilitated without check. Phloxes resent coddling, and the best results are always obtained from sturdy short-jointed plants, hence they should be grown under light, well-ventilated conditions from their earliest stages. The position of the beds or borders in which Phlox Drummondii are planted should be open and away from the influence of trees. They are very impatient of shade and give indifferent results in enclosed positions. The beds should also be well prepared to enable the plants to make free growth, when they will not fail to produce a display of flower throughout the summer. Apart from their value as summer bedders, the annual Phloxes are excellent as pot plants for greenhouse and conservatory decoration, and when grown in 5-inch pots in a rich compost they are conspicuous for the richness of their display. W. AUTON.

Tufted Pansies

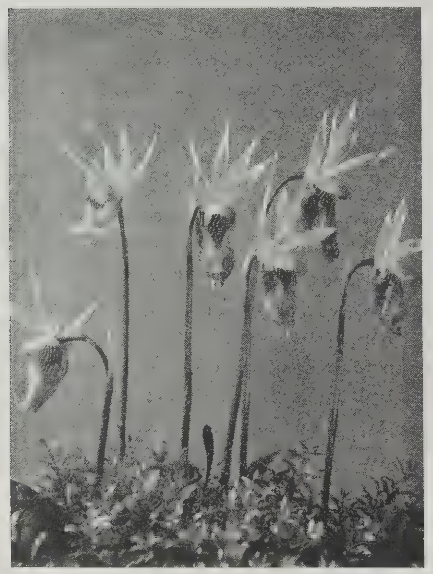
Large quantities of these beautiful flowers are used to carpet beds of Roses to form broad edgings and other purposes. Those plants which have been growing in cold frames and are now healthy and strong may, when thoroughly hardened, be planted in their flowering quarters. These love a friable soil which has received an addition of well-decayed manure into which they will root rapidly. The removal of these to the beds will also make way for the hosts of other subjects which, although not ready for the open air, are sorely in need of more room in which to strengthen and expand.

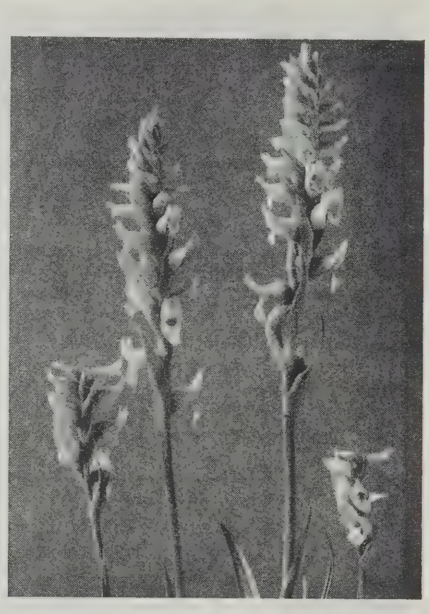
Little-Known Orchids of Europe

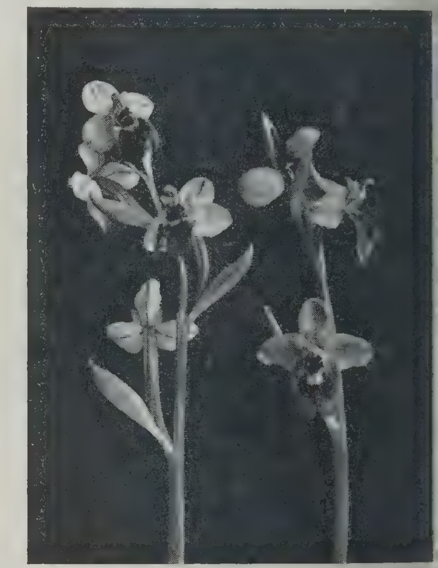
By T A STEPHENSON, D.Sc., Department of Zoology, University College, London

The wild Orchids of Europe present a field for exploration which offers opportunities to the holiday-maker on the Continent, and the following article, which appeared in "Discovery," is reprinted by permission. There is much scope for the experimental hybridisation of these curious plants.

TROPICAL Orchids of the more showy kinds are familiar objects to many, with their curious and reptilian as well as elaborate and beautiful forms. Their culture, moreover, is a well-studied art, and a considerable amount of experimentally-gained knowledge exists of their potentialities and behaviour when hybridised with one another. The wild Orchids of Europe, on the other hand, present a field which has been less fully explored, at least on the cultural and experimental side; nor are these plants well known to the public as are their tropical counterparts. The number of species of Orchids which occur wild in Europe is, however, considerable, and although their flowers are usually built upon a smaller scale than those of the ordinary hot-house species, they exhibit a variety of curious form which parallels that of the larger and more imposing species. There exist, of course, many tropical species with small flowers; but since these are less often exhibited in public places than the showy varieties, their existence is not obvious to the uninitiated.







Figs. 1—3

Interesting types of European Orchids

1 (*left*). Calypso borealis, one of the most interesting of European Orchids. 2 (*centre*). Spiranthes Romanzoffiana, the Irish "Ladies Tresses." 3 (*right*). Ophrys tenthredinifera, one of the insect-like Orchids

A few of the more interesting European Orchids are illustrated in this article. Of these none is more beautiful than the species illustrated in Fig. 1, the rare Calypso borealis, in which each flowering stem bears a single pink flower with markings in other colours upon the hollow slipper-like lower petal (the lip). Another beautiful but extremely rare species is that shown in Fig. 2, Spiranthes stricta, more usually known as S. Romanzoffiana. This plant has small cream-coloured flowers, but they are borne in a graceful spiral formation upon the stalk. It is interesting particularly because of its distribution, being a plant which occurs in Ireland alone on the European side of the Atlantic, but which is not uncommon in North America.

It is a marked characteristic of the European Orchids that many of them hybridise more or less freely in the wild, and that the hybridisation is by no means limited to an interchange between related species; hybrids between species belonging to different genera are of frequent occurrence, and there are also on record cases which are probably due to secondary crosses between a hybrid and one of its parents or between a hybrid and another species. Some of the hybrids produced are plants of unusual appearance, and the manner in which the various characteristics of the diverse parents are combined in them also makes an interesting study. Most of our knowledge of these hybrids, however, has been gained by field work and descriptive analysis, and there is much room for experimental hybridisation and for the following of the development of the hybrids through several generations. It has been claimed that among these Orchids, as elsewhere, a new species may arise from the stabilisation of a stock of hybrid origin, and an experimental proof of this would be a valuable contribution to the study of evolution. The difficulties in the way are, among others, that these terrestrial Orchids cannot, any more than the kinds more usually cultivated, be successfully reared without an adequate nursery and much expenditure of time, and that a young plant produced from seed does not flower for a number of years—sometimes as many as 16—after germination.

The occurrence and peculiarities of hybrids may now be further considered. Wherever two species of Orchid grow together, hybrids may occur (unless the species concerned should be such as to render hybridisation impossible), but it does not follow that they will do so; in one locality hybrids between two given species will be more or less frequent, in another spot the same two species may grow together, but no hybrids will be found. All species do not, moreover, hybridise with equal readiness. The hybrids produced are generally of the kind which present an appearance intermediate between that of two parents, but sometimes (and especially complex hybrids) the characteristics of parent predominate; new features apparent in either parent may also appe In hybrids between the genera Orchis Serapias, the flowers have no spur on lip; in this case the spur is present in Orc and absent in Serapias, and has been s pressed in the hybrids. In crosses betw Orchis and the spurless genus Aceras, the other hand, the spur is present, but shorter than in Orchis. In some cases th is considerable variation between differ examples of the same hybrid. A more tailed account of the hybrids of Europ Orchids, which also takes into account experimentally produced exotic hybrids, be found in an interesting paper by Colo M. J. Godfery, entitled "Natural Orc Hybrids," in "Genetica," IX., 1927, p. This paper is well illustrated.

Among the interesting facts which the a ficial crossing of Orchids has elicited are following (quoted from the article by Godf above mentioned). In some crosses the fluence of the male or female parent is strong that the other is swamped almost quite completely. If Sophronitis grandifl be crossed with Epidendrum radicans, hybrid (which can only be obtained with Epidendrum as male parent) is almost exa like a dwarf Epidendrum. An even m striking case is that in which Zygopetal Mackayi was used as female parent in a cr with pollen from Odontoglossum, Lyca etc. The hybrids appeared to be pure Zy petalum, and four hundred seedlings rai exactly resembled the mother plant. A pl of the fourth generation of Zygopetalu fertilised in each case with Odontogloss crispum, still reproduced the Zygopetal unchanged.

A number of European Orchids (belong to the genus Ophrys) have the lip so modi that it resembles some insect very strong the other petals also lending themselves the general effect. The sepals, on the ot hand, remain petal-like, and are of brightly coloured, so that the total effect that of an insect which has alighted upo flower. The lip possesses smooth areas hairy or velvety ones, and is so shaped

ed that it may resemble either a bee,
or a spider. That it is really intended
mble an insect is evident from some of
tails of its structure—it may possess
resembling eyes, situated in the right
and in two of the examples shown in
companying illustrations (Fig. 5), the
ssesses lobes which resemble folded
(held at different angles in the two
as well as hummocks at the bases of
ter which suggest the elbows of flexed
legs. In other cases a bluish shiny
n the middle of the lip gives the illu-
the bluish sheen on the folded wings
y. There are too many resemblances
d for explanation on the ground of
nt. The matter is clinched by recent
ations, which show that in certain of
species the lip is mistaken by certain
nsects for a female of the same kind;
ale alights upon the supposed female
tempts to fertilise her; carrying away
len of the Orchid incidentally and with
cting the fertilisation of another
-flower. This adaptation is one of the
nteresting instances of the type to be
and it is one which calls for careful
on from those who would explain the
nena of evolution by natural selection
this alone.

y of the European Orchids are rela-
constant in type, the species being
arked and easily recognisable. This does not apply universally, however, and the contrary condition is best exemplified among those species of the genus Orchis which possess palmately-divided root-tubers (the Dactylorchids). These are the marsh Orchids and spotted Orchids so common in Great Britain and in Europe generally. Among these forms the species are sometimes rather similar to one another, and in certain localities several of them occur together and hybridise so freely that a casual collector entering a field populated by one of these colonies might well be excused for mistaking the species and hybrids involved for a single kind of Orchid exhibiting a wide range of variation. A considerable amount of work has recently been done on these difficult species, from which it has emerged that there are indeed a number of different kinds involved, with hybrids linking them up. The distribution of these forms is interesting. In North Africa there is found, to begin with, the showy purple species illustrated in Fig. 4 (Orchis Munbyana), a plant which may attain a height of 3 feet or more. In Spain, Corsica, and the southern part of France, this form is replaced by multitudes of a similar tall plant, with sword-like leaves and long purple spikes (O. sesquepedalis); this form is also found with O. Munbyana in North Africa. In the northern part of France, however, there appears a third species (O. prætermissa), which is rather like a shorter and more compact edition of O. sesquepedalis. This form extends into the Netherlands and all over the southern parts of the British Isles, but as one goes north and west in the latter area there become more and more frequent two forms (O. purpurella and O. pulchella) which resemble it but possess flowers of a rich, deep purple unknown in the other kinds; one of these is distinctly a dwarf plant, and both of them are characteristic of the north and west of Scotland and of northern England. Other marsh or spotted Orchids do not belong to the series just described, but range over the whole area involved from the Shetlands to Spain or further; and in the eastern part of Europe other factors become involved. A detailed study of the marsh Orchids, on modern lines, taking into consideration not only their morphology and cytology, but also their ecology, is being made by Dr. H. Ziegenspeck of the University of Königsberg; some of the results of this work, done in collaboration with the late Prof. A. Fuchs, have already been published in the "Botanisches Archiv" (II.-XX.), edited by Dr. Carl Mez, of Königsberg, and in "Naturwiss, Vereins für Schwaben," Augsburg, 1919 and 1924.

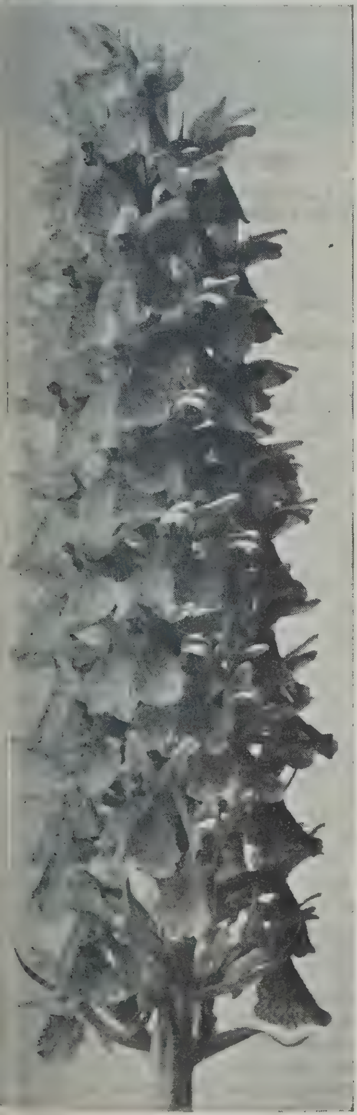


Fig. 4

Typical Marsh Orchid

(Orchis Munbyana)

It has been mentioned above that the hybrid Sophronitis grandiflora x Epidendrum radicans can only be obtained by using the Sophronitis as the female parent. Some of the reasons for results of this kind are as follows. The Sophronitis only develops short pollen-tubes; and the ripe seed-capsule of a Cattleya fertilised by its pollen produced mature seeds at the top only, the rest of the capsule being full of chaff. Similarly, Cochlioda nœtzliana is a good plant to use as female parent, but its pollen usually fails to fertilise Odontoglossum, whose pollen-tubes have a much longer distance to traverse. Again, in some cases the pollen-tubes of one species may be too large to enter the micropyle in the ovules of another. In yet other instances, the time which is required for the ovules of one parent to become ready for fertilisation does not fit in with the time required for the pollen-tubes of the other parent to reach the ovules; the times involved varying from seven to ten days to as much as three months. If plants are crossed whose germ-cells require very different periods of these processes, the development of the ovules may be fatally checked by the failure of the pollen-tubes to reach them in time; as conversely the pollen-tubes may have lost their fertilising power before the ovules are sufficiently mature to receive their contents. These facts are mentioned here, because although derived from the study of cultivated species, they are no doubt applicable to some of the wild forms also.

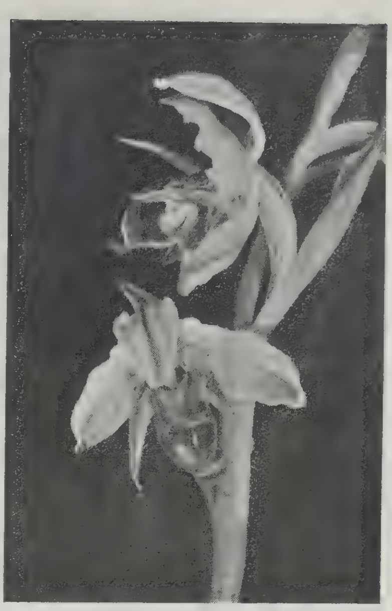

Fig. 5

Another insect-like Orchid

(Ophrys cornuta)

For the photographs which illustrate this article I am very much indebted to Mr. W. H. St. Quintin (Figs. 1, 2, and 5), Dr. F. Pfeiffer-Wellheim (Fig. 4), and Dr. T. Stephenson (Fig. 3). Dr. Pfeiffer-Wellheim, of Vienna, (Wien IV, Mommsengasse 21), has produced a series of beautiful stereoscopic photographs of European Orchids, copies of which may be purchased from him.

Verbenas

Verbenas are not only very showy flowering plants for the garden in summer, but they can be brought into use for window boxes, baskets, and for pot culture in a cool house. One's mind travels a long way back, when they were raised from cuttings, procured from old plants kept in the greenhouse all winter, often under great difficulty. All that is now changed, as from a packet of seed sown in the warmth of the greenhouse during March a compost made up of loam and leaf mould and sharp silver sand, one may have plants ready for outside by the end of May. Verbenas are very effective when grown in beds to themselves, and pegged down, the centre shoot of each plant when 3 inches or 4 inches long being pinched to induce lateral growths. There is another, V. venosa, which is described as "a handsome hardy perennial," but I think this needs qualification, as my experience of it is something akin to certain perennial forms of Lobelia, that one can only rely on keeping from year to year by lifting and wintering the roots in a cold frame. There is this much to be said in favour of V. venosa, however, that if seed is sown in heat in March, resultant plants will bloom in July. The colour of this species is a vivid purple, most prolific with its flowers, and excites admiration wherever grown. It grows about a foot in height, and remains in bloom for several months.

TWO HANDSOME NEW DAFFODILS RAISED BY THE BRODIE OF BRODIE

Fortune's Glory, a good yellow Incomparabilis with red crown. Raised from Fortune

Clwyd, a large and bold bicolor Barrii Award of Merit, 1928

The Evolution of the Daffodil Over Half a Century—III.

By ALBERT F. CALVERT, F.C.S., Author of "Daffodil-growing for Pleasure and Profit"

(Concluded from page 208)

ABOUT 1910 the late Mr. E. M. Crosfield, one of our most skilled breeders, placed some fine things on the market, among the most notable being Firetail, Empire, and Gyrfalcon.

Then, what shall one say about Will Scarlett, with its debatable points? The Brodie of Brodie says that: "We often find ourselves wishing that this astonishing flower had never been invented." And that this "is a strain which is so glaring that it almost requires to be viewed through smoked glasses." No doubt the flower is coarse and the colour may be crude, especially of the petals, which are often somewhat muddy in colour, but the type has made its name on the markets; it is successful, and makes a good pollen-bearer, too, for further work of hybridising, which may eliminate some of the coarseness of which complaint is made.

In the divisions of Incomparabilis and Poeticus the greatest progress has been made, but there is a large field in the Trumpet class, as it may be termed—the Magni-coronati. We have very few first-class Daffodils of the Fortune class, for a great many of the Trumpets are inclined to be coarse and rough, though I had thought that forcing might eliminate some of the coarseness. I say "had thought" because I see in one of the horticultural trade journals that Mr. Herbert Chapman, a noted raiser of Rye, says he has seen Fortune forced, and, to quote his remarks: "It was quite unrecognisable, for it was quite lacking in that beautiful rich coppery-orange colour which is the usual striking feature of its large cup." But Mr. Chapman has seen it forced once only, and the bulb may not have been acclimatised when producing its flowers—an important point for all forcers to consider—so we must wait for corroborative evidence before condemning Fortune as a forcer.

Fortune has proved to be invaluable for breeding, as several first-class flowers have already been raised from it. As soon as the beauty and value of this flower was realised a bulb was sent to The Brodie of Brodie, and he was the first to use it in his crosses. He has succeeded in raising a number of fine flowers from it, among which are the following:—Whiteley Gem, Fortune's Pride, Fortune's Glory, Fortune's Crown, Fortune's Beauty, Fortune's Star, Fortune's Gleam, Tashkend, Basra, Bokhara, and Copper Bowl.

In the white Trumpet section the advent of Mme. de Graaff marked a new era, but for some reason white Trumpets have never really "taken on," though we have some very fine specimens, thanks to the indefatigable work of Mr. Engleheart, whose work with this type and the Leedsii is well known. White Emperor (Engleheart) created a sensation in 1913 when first it was shown; not a large bloom, yet its exquisite proportions and smoothness of quality are proving of the utmost value to breeders. Then
Mr. Engleheart's Beersheba, whi
course, eclipses any of its predecessors

The Brodie of Brodie, too, has spe
upon white Daffodils, as witness hi
bury, China Clay, Cokefield, Eskimo,

is is of the newest bulbs; let us hark
lf a century and note some of the
evailing for the varieties with which
o familiar at this time.

nteresting to note the rise and fall of
r Daffodil bulbs, though it should be
rice, as such, does not necessarily
the degree of demand, for it mainly
e rarity of the bulb and its novelty,
ainly its beauty and utility. For in-
who would now care to pay 1s. per
lbs for Scilly White? That was the
ked by Hartland in 1894. Most
nsider 1s. per 100 too dear now.
Iorsfieldii at 5s. per dozen when we
ow give 18s. to £1 per cwt. Em-
1s. each in 1894 is now about 30s.
for selected bulbs. Soleil d'Or at
l.per dozen and Grand Monarque at
3s. represent a drop of about 300 per cent. now.

Golden Spur was listed at 4d. each, and now about £30 per ton. And what shall we say to M. J. Berkeley at 2s. 6d. each? A now well-nigh unsaleable bulb. In 1895 Mme. de Graaff was listed by Hartland at £3 per bulb, and this, surely, was a modest price for such a gem, but it holds its own among a small coterie of growers and raisers. Sir Watkin at 6d. per bulb; but, of course, this fine old variety was in general use, even then, and still is in good demand. During 1923-4 this variety was changing hands at from £50 to £70 per ton, and was scarce at this high price.

In 1899, only four years later than Hartland's prices quoted above (in 1895), we may note how prices had fallen. They were not mere fluctuations with which the bulb business is badly afflicted, but a definite drop in current values. Messrs. Barr and Sugden were offering collections for amateurs at 75 bulbs for 21s. and 45 bulbs for 12s. 6d., all named sorts, including Golden Spur, Maximus, Irving, Sir Watkin, Barrii conspicuus, C. J. Backhouse, Emperor, and so on.

Grand Monarque was, in 1899, quoted at 3d. per bulb and Scilly White at 2d., whilst Soleil d'Or came to 3d., and so, right through the whole gamut, prices dropped. It seems, when looking through the very oldest of catalogues, that the most expensive varieties then are now the least costly. Looking through Messrs. Barr's list for 1876 we find Tazetta Compressor listed at 10s. 6d. per dozen; now the variety would be almost unsaleable. Recurvus was 1s. 6d. each then, but about £15 per ton now. In 1878 Obvallaris was 4s. 6d. per dozen and Maximus 2s. 6d., and in 1881 the former had dropped to 1s. 6d., whilst the latter remained stationary. Imagine prices at 1s. 6d. per dozen! Barrii conspicuus was listed as a new variety in Barr's catalogue of 1881 at 1s. per bulb, and I suppose one could buy good Barrii to-day at about £20 per ton, though as late as 1902 Barrii was quoted by Hartland at 1s. per dozen or £2 10s. per thousand. Barrii has steadily maintained its price, however. It is a very popular market sort, and during 1920-3 it was freely sold at £50 to £60 per ton wholesale and at £2 10s. to £3 per thousand.

Of course, the price of flowers to some extent governs the price of bulbs; that is, those bulbs that are grown for commercial flower culture, and this causes great fluctuations. New hybrids, however, will hold their own in any season until they become well mixed up in commerce up and down the country.

Interest in the Daffodil was never keener, and there is still great scope for those with ability and patience.

Success with Lapagerias

There are few more beautiful climbing plants than Lapagerias when seen in full flower, with their long, tubular blossoms of white or rosy-pink descending from amid foliage of deepest green, but it has to be said of them that their employment as plants in a stove house has given many the idea that it is no use attempting their culture in a greenhouse where only a moderate temperature is maintained. This creeper, however, which used to be met with almost exclusively in stove houses, is to be found at home in the greenhouse when given right treatment.

Whilst, for the sake of convenience, Lapagerias are sometimes planted out in a border within a house, it should be pointed out that experience has proved that it is better to avoid a deep root-run. Soil for them should be made up of good fibrous loam, peat, and leaf-mould, coarse sand, or sandstone chippings, with broken charcoal to ensure sweetness. The drainage is an important point, and if it is decided to plant in a large pot or tub sufficient must be provided. If the pot cannot stand on the ground it is advisable to place it where it can readily be seen and attended to, as Lapagerias will take an immense amount of water, especially near the blooming season. Some growers stand the receptacle in which the plant is grown on fine ashes, which conserves moisture. If planting out within the house in a bed is preferred care ought to be taken to restrict the ramification of the roots by placing brickbats about 3 feet below the surface and to ensure drainage. For although the plants love moisture, there is such a thing as over-moistening the soil before the roots have had time to permeate it, and nothing is more fatal to Lapagerias than stagnation of the roots. These precautions may seem rather formidable to those who have never attempted the culture of so beautiful a climber as this one, but they should not prevent anyone with a greenhouse which is heated in winter for other things, and I mean by this, that the maximum heat in winter should not be more than 50 degs. and in summer more than 65 degs. Spring is a suitable time to procure Lapagerias for planting, and it is well to observe that for the first year, if they do not appear to grow very rapidly, no attempt should be made to force growth. The liquid-manure tub must be banished. In the case of this plant nothing beyond what is contained in the compost suggested for them is needed, but in a greenhouse endeavour to give them a position where they will not be directly under the sun's rays. If this is not possible, then during summer the roof will have to be shaded. The foliage ought not to touch the glass, and to avoid this it is best to fix up wires a foot below the roof to which the growths can be tied out. Lapagerias delight in shade and moisture in their growing season, and therefore they should be syringed daily in the evenings, which will do much to keep them in vigour. What they do not like is a dry, close atmosphere, hence the advisability during the summer months of giving abundance of air. It is when plants are grown in a close, stuffy atmosphere and allowed to become dry and neglected that trouble begins in the shape of Green Fly and Red Spider, and, in the case of neglecting to syringe them, Mealy Bug, which makes its lodging on old leaves. No creeper is more charming in its time of blooming than the Lapageria, but success can only be achieved by carrying out rational treatment and keeping plants clean. While it is as a roof climber, with the tubular blossoms hanging, that the Lapageria can be most appreciated, it should be observed that a back lean-to wall in a greenhouse can also be used for them, but in that case the framework should be erected away from the wall in order to admit of a circulation of air.

In procuring plants it is better to start with young ones rather than those of some years' growth, for the reason that one can train young plants better. Pruning consists in the removal of thin, weakly growths. In tying out the shoots give them what room is possible for development. Lapageria roseum is the species, and from this there are several varieties, amongst them being L. rubra (red) and L. alba (white). They flower almost continuously from early summer until late in autumn.

W. F.

Cinerarias for early blooming

Where wanted in flower early seeds should now be sown and placed in a cool pit or greenhouse. Shade from all bright sunshine must be provided at all stages of growth. Coolness is one of the main essentials in the cultivation of this plant.

EASTER WEEK IN THE GARDEN

Southern and Midland

Indoor Peaches

The disbudding of the trees must be carried out before the shoots exceed 1½ inches in length, and on well-trained trees it is usually sufficient to leave one sound growth as near the base of each twig as possible and one at the tip, the latter to be stopped when about 4 inches in length unless extension is desirable, as in the case of young trees. While it is not desirable to disbud the whole of a tree on one day much may be done at a single operation without injury. It is unwise to overcrowd the trees with young wood at any time, as this results in a lot of thin, weakly growths which are unable to ripen properly and, as a consequence, produce poor quality fruit.

Tomatoes

The earliest plants should now be ready for their fruiting-pots or for planting out in prepared borders. Good but not unduly enriched soil is advisable, for if manure is used extravagantly the whole crop will develop rankness and become a total failure, and it is of the utmost importance that such a state of things should be forestalled. The later sowings are ready for pricking off into small pots, and from this date growth will be more rapid. A final sowing for providing a batch of plants for the open should now be made.

Forced trees and shrubs

In addition to their use in providing cut flowers these are often used for the decoration of rooms, where they have to remain—often in draughty and uncongenial positions—far too long, the result being that when finally removed they present a pale, drawn, and unhealthy appearance, and not infrequently those of an evergreen character often shed a large percentage of their leaves, and in order to bring such back to a healthy condition it is necessary to place them in a warm house for a time, where watering may be carried out with care and frequent syringings given. Most shrubs respond freely to gentle warmth at this season. If brought forward with discretion, and with the many bulbous plants also available, there should be no shortage of indoor flowers.

Roses and other shrubs damaged by frost

It is now only too apparent that considerable growth has been destroyed, especially among climbing Roses and shrubs, the curious point being that old specimens of a genus are absolutely killed, whereas young examples are only slightly injured. I strongly advise the cutting hard back at once of all such, trusting to the formation of new growth from the base, there being no satisfactory alternative. To leave quantities of half-killed growth only impedes the formation of new wood and is a loss of time. The pruning of decorative Roses should be continued, and any doubtful old growths should be cut clean out.

Hardy fruit

Trees growing on the east sides of walls are liable to become exceedingly dry even in the depth of winter, and it is advisable to examine such, and, where necessary, apply a thorough soaking of water, or the partial loss of the season's crop may be incurred. All pruning must now cease, except among newly planted trees.

Strawberries

Stir up the soil—but not deeply—among established beds, removing dead leaves and other foreign matter in order to encourage growth and give the beds a pleasant appearance. Young plantations will be improved by hoeing.

Onions in boxes

Those pricked off at the beginning of the month are growing freely and may now be transferred to sheltered cold frames,
are closed early in the afternoon.

Fine clusters of even-sized Tomatoes of the Up-to-Date variety

VEGETABLES

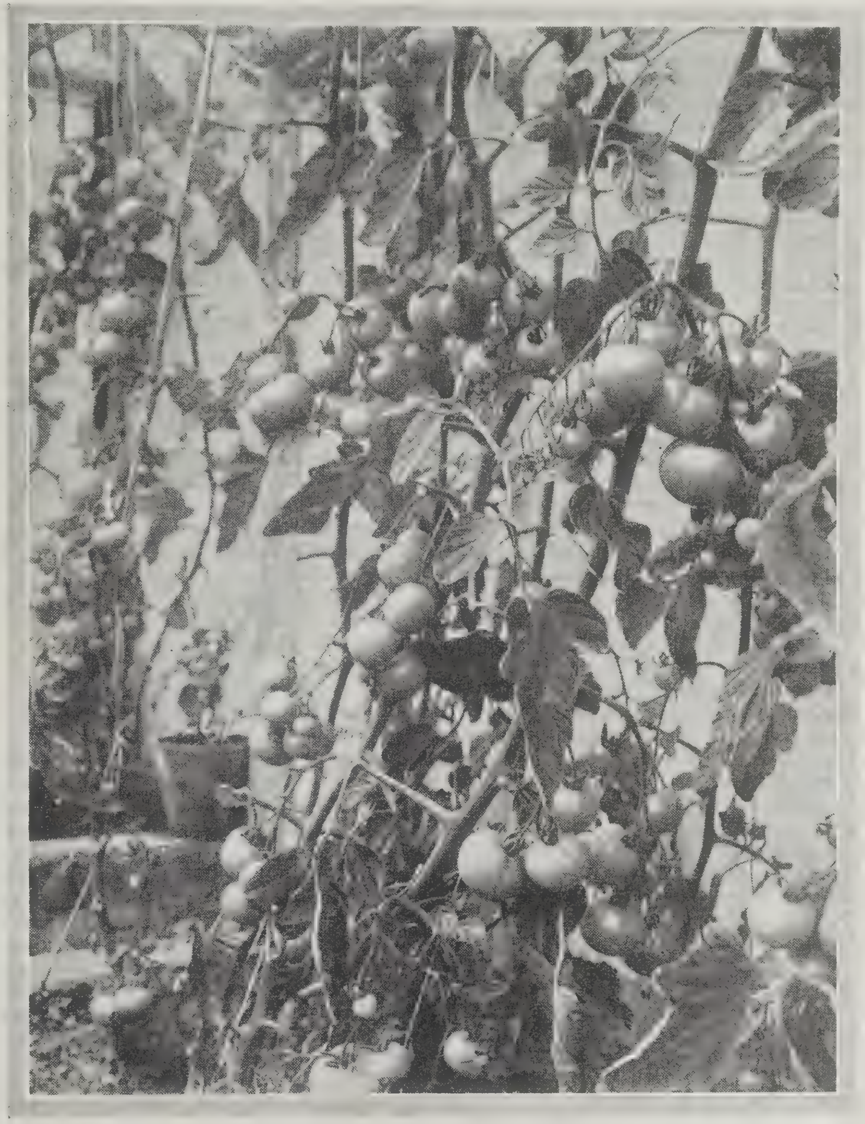
Tomato culture

ONE who has a glass house, small arge, should not miss putting in a Tomato plants during April. Large of this table delicacy can be easily by the most modest amateur at a ll cost. Good plants can be pur- any nurseyman's for a few pence d in a cold house with a little ttention they will produce good crops ble or the market. Tomato culture ting and profitable, but several small eed attention if success is to be These points are apt to be over- not sufficiently understood.

ass should be in a position facing t too high a roof but with plenty tation if needed. The plants want mth, and air; above all, they require atering and a fairly dry atmosphere. ot days come round the windows opened and the glass of the roof ; extreme heat is bad. The plants ally sold in small pots; this is best can be transferred to the house dation without disturbing the roots. plants should be selected; there are d varieties, so that we can take the an's recommendation without fear. ety that is advised for outdoor plant- lo well in the cold house. It is best to plant them where they are to remain to fruit and large pots must be provided if pots are used. The best way is to have brick troughs, filled with earth to within a foot of the top. These can be built round the sides of the house and filled as follows. First we place a layer of broken pots and gravelly sand for drainage, then another layer of about 6 inches of sharp sand which will ensure that the roots become more fibrous. We must always keep in mind that it is the fibrous roots that produce the fruit and that the long, fleshy roots throw long, lanky stems. Too much water will also produce lankiness. The aim must be to get the plants to fruit at as short an interval as possible up the stems and the conditions of growth must be planned to this end. A layer of at least 18 inches of good soil is then placed in the trough, but quite 12 inches of depth at the top must be left as this will be needed afterwards. The soil should be well sifted first and no manure, soot, or artificial manures used. With Tomatoes the feeding is done from the top after the second lot of fruit has set and not before. The young plants are planted well down into the soil, taking care not to injure any roots; they will soon go ahead and should be watered daily.

When the flowers come we can help the setting of the fruit by gently tapping the vine supports. As a rule the first set of flowers does not produce any fruit to speak of, and the amateur need not be troubled by this. As the second and third lot of flowers appear we must give support to the stems; we now must speak of them as vines, for with the coming of the fourth set of flowers the growth is very rapid. Tapes or string hung from the top of the house will be found equal to canes or sticks. Just under the joint of the leaf stems is the place for the tying, and care must be taken not to bruise the stems, or bleeding will take place. At this stage we must add more earth; in fact, it is a golden rule to add an inch or more of soil when every set of flowers appears until the trough is about full. This also applies to pots, of course. Also we now begin to feed the plants with liquid manure; at first with a weak solution, and as the fruit grows we can increase the strength in proportion.

Side shoots are pinched out as they appear and the leaves are cut back as the fruit grows. This must be done in the noon of day to give the cut a chance to dry quickly. I think it best to trim the leaves away from the fruit clusters as they become fair sized. This will give the fruit a chance to ripen and to receive the nourishment that the leaves would be taking. The top of the vine can be



Tomatoes well repay cultivation

Plants should be put in the cold house in April taken out after the eighth or tenth set of flowers, but growers will be well advised to limit the vine to not more than eight clusters. The last sets of flowers do not seem to produce fruit before the first frosts of the autumn come, and it is best to be content with eight good clusters than have inferior fruit at the head of the vine. Early fruit for the market is taken from the plants before fully ripened, and quickly ripens in the light on shelves. This is a good plan as it allows the other fruit to benefit, and it gives us the earlier and better prices of the first deliveries.

There is a market for good English Tomatoes, and any of the local stores will gladly pay full wholesale prices ruling at th and will ask for more. The points t in the gathering and marketing ar the Tomatoes should be clean and c packed, they should be picked with t and sepals attached to the fruit, a should be of even size as far as pos

DAVID L

MY GRANDMOTHER

By SIR WILLIAM LAWRENCE, Bart.

(Concluded from page 204)

LADY LONDONDERRY tells me she has a portrait of Anne, Marchioness of Londonderry, who, it will be seen, is wearing flowers in her hair; it looks as if the servant aped her mistress. However, we must hope that all went well in the end, for the correspondence concludes by Lord Londonderry sending my Grandmother a haunch of venison.

Eighteen shillings a week in the 'forties appears to have been the right wages for a head gardener. Thus the Duchess of Leinster writes from Carton, Maynooth, Ireland:—"Many thanks, my dear Mrs. Lawrence, for the trouble you have so kindly taken. I have no doubt that the person you mention, of the name of Johnston, will answer very well. I hope he is a single man, for there is not space for a man with a family in the cottage intended for him, which has but two small rooms. We should propose (if you approve) giving him 18s. a week, with lodging, firing, and a little bit of ground for vegetables, no candles. If he agrees to this and will send me his direction, I need not give you any further trouble, and we should engage him from March 1st, when the cottage will be vacant."

In 1842, or perhaps later, Sir E. Bulwer Lytton, afterwards Lord Lytton, the distinguished novelist, writing from Bayons Manor, says:—"The wages my present gardener receives are only 18s. a week and a cottage rent free, but the wages in the country are lower than those near town. I should probably not get the sort of man I want for the same terms. On the other hand, if the wages were too high, I should probably have but a fine gentleman—a superintendent—and not a working gardener which I require. . . . I am at a loss exactly to fix what I had best give, but wages would probably not be the obstacle if in other respects the person suited me."

Even in 1845 there were gardeners who did not like advice, for the Duchess of Beaufort writes from Llangattock:—"I am now at a little cottage of ours in Breconshire, in a beautiful country, and where I am making a very humble little flower garden.

"Many thanks for your kind offer about my gardener going over to Ealing Park. I think I will not avail myself of it at this moment, as I am in the act of changing my establishment in that respect. I am sending away the man you saw who did not produce a better show in my garden this year than he did last, and I have now got a very good working man who is to be under my head gardener, and I hope he will do better than the last, who was too fine a gentleman for me, and did not like advice, even from you, who may be allowed to be qualified to give it. We shall not be fixed at Badminton for the next month; when we are, I shall write to remind you of your promise of again visiting us, and I hope then you will see a little improvement in the state of things."

The Duchess was a keen gardener, and there are many references to Roses and Verbenas which were sent from Ealing Park to Badminton, and my Grandmother was wont to send baskets of hot-house flowers to the Duchess for her parties; and, indeed, she frequently furnished the ballrooms of her friends in this way. Lord Hardinge, to whom I referred above in connection with the Amherstia, used to get a great many Indian plants for my Grandmother through Sir John Littless, who was Governor-General of Bengal; Lord Hardinge himself grew a number of plants at South Park, and mentions that he has Mountain Bamboo growing out of doors from seed in very high perfection, and expresses the hope that it will resist the frost as he gathered it near the Himalayas.

MIETZING

Baron Hugel, of Vienna, the famous botanist, was a frequent correspondent. In, apparently, 1844, he sent over the following plants:—

- Lasiopetalum floribundum,
- Lasiopetalum grandiflorum,
- Boronia spatulata,
- Manettia versicolor,
- Hemiandra pungens,
- Cæsia Helleri,
- Pimelia Meipergiana,
- Nuytsia floribunda,
- Gentiana antartica,
- Prostranthera retusa,
- Callicarpa japonica,
- Lilium lancifolium rubrum (novelty from Mietzing),

in charge of the First Secretary of the British Embassy. In November, of the the same year, his head gardener, M. Daniel, pays a visit to Ealing. Of him the Baron writes:—"He has a beautiful and charming wife and two little girls, but I believe that he prefers flowers to any of them. He is a man of wide experience in propagation and cultivation of all plants. However, he knows Orchids less well, as they are in charge of an under gardener. If you think it suitable, M. Daniel can plant my tree (doubtless the reference is to a Deodar) on my behalf in the same way as Princesses are married by proxy by the Ambassador. M. Daniel knows my collection of plants, with the exception of the Orchids, better than I do myself, and he will be able to offer you anything you like in exchange for the beautiful flowers you have given me; perhaps you will be good enough to allow your head gardener to give M. Daniel cuttings of any plants which he may desire, and which you can spare."

PARIS.

Next there comes the turn of Paris, where my Grandmother sent 11 species of Orchids in 1842. M. Richard, Professor of the Faculty of Medicine in Paris, writes on April 22nd, 1842:—

"Unfortunately, on my arrival in Paris I found myself face to face with so serious a position that for several days I was undecided what to do. I found that the two pieces of Epidendrum erubescens which I possessed were dead. The cause was carelessness on the part of one of the younger gardeners. You can imagine my chagrin when I was impossible completely to fu promise which I had made to you. ever, I had remembered that there a single piece in existence, namely, gium, and accordingly I wrote at o it should be sent to me, no matte price they might put on it there. This specimen reached me, and it is now way to you. But it is far from b good condition. Under careful treat think it will grow, but it is far from brilliant condition. Meanwhile, *it is piece which exists in Europe,* and if fortune it does not succeed with y will have the consolation to know one else in the world possesses th . . . I have added to Epidendrum er (a very sick plant) and to Odonto membranaceum, the only two spec asked for, three other species which I are not to be found in your magnific lection: (1) Cæsia macrostachya, L did not see a living plant of this which has pink flowers, in any colle London. (2) Oncidium Lindleyanum species from Brazil. (3) Oncidium ceras, Hooker. I desire, Madame, t will see in this little addition the since which I feel to show you all my gr I have just heard that a consignm Orchids from Havana will arrive in J will be my duty and my pleasure t them with you, and I believe you w some plants which are worthy to be f your magnificent collection. Since turn to Paris I have felt very strong ing regard to what I saw in Lond especially at Ealing Park, that my c was far from being a good one."

M. Richard then explains that he ing plants by the Boulogne to Dove and that he has placed at the bottom case not only some botanical books b the two dead pieces of Epidendrum, my Grandmother can assure herself other plant exists in the world!

Just as to-day, the Rothschilds wer gardeners, Baron James de Rothschi ing from Paris in 1843, arranges an ex of plants, his plants to be sent thro nephew in London. The Baron and B de Rothschild, who lived at Gunne were constant visitors at Ealing Park. had eight children, whom they were bring over to play with my two aunts

THE ROYAL BOTANICAL SOCIE LONDON

On March 25th, 1843, the Secretary, de C. Sowerby, writes:—"The Counc Royal Botanic Society having been in that a large plant of the Andromed bunda would be acceptable, have direc to forward you one, and selected the but one in their garden. The largest been moved last year is not now in suc condition. I am also directed to assu that the Council feel it an honour

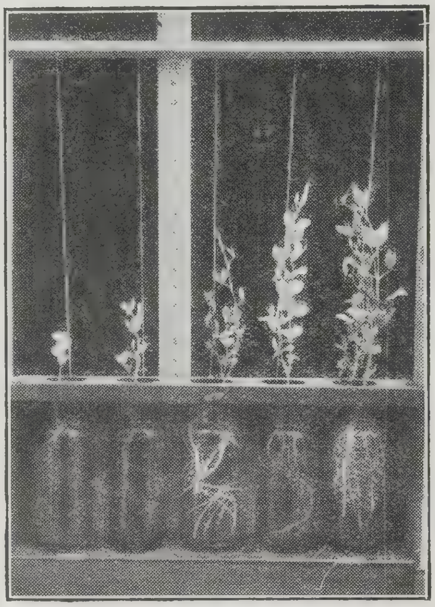
FISONS' FERTILIZERS
FOR GARDEN and LAWN



No Fertilizer used — *Nitrogen only* — *Phosphate only* — *Nitrogen and Potash only* — *Fisons' Complete Fertilizer*

SWEET PEAS GROWING IN DISTILLED WATER.

A SMALL outlay on Fisons' Fertilizers will enable your crops to be increased greatly, blooms improved, and the season extended.

It is most important when feeding Flowers and Vegetables to use perfectly blended, properly proportioned foods. This is secured by using Fisons' Fertilizers, which will increase the yield of your garden.

Fisons' Technical Bureau

Following nearly a century of experience in research in soils and Fertilizers, a vast amount of data has been accumulated and is freely at the service of our clients. No obligation is incurred by writing to us for advice, which we shall be pleased to give to the best of our ability. The feeding of turf, flowers, vegetables, and fruit is a fascinating subject, and comparatively few gardeners are aware of the really amazing results that can be achieved for a small outlay of money.

FISONS'
CANARY GUANO
(A Compound Fertilizer)

is a scientifically compounded general garden Fertilizer. Largely organic in nature it may be used with perfect safety. Canary Guano has the largest sale of any horticultural Fertilizer in the world and is used by leading exhibition growers. Use 4 ozs. to the square yard for Fruit and Flowers.

PRICES (in bags):	7 lbs.	14 lbs	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**5/-**	**9/-**	**16/-**	**26/6**

FISONS'
CHAMPION FERTILIZER
For Potatoes and Vegetables

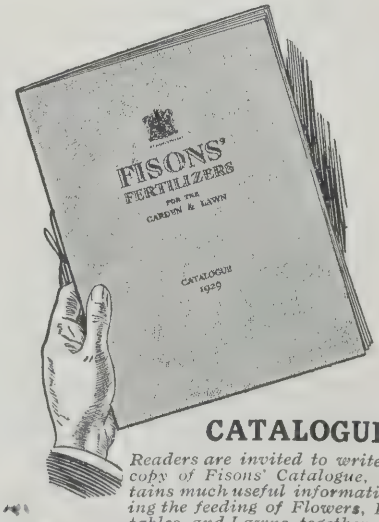
is recognized as the most productive Fertilizer for Potatoes and Vegetables. It is the product of prolonged experiment and research. Rapid growth and early maturity of first quality and heavier crops are assured. Use 11 lbs. to the rod.

PRICES (in bags):	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**4/6**	**7/-**	**12/6**	**19/-**

FISONS' SPECIAL
ROSE FERTILIZER

Roses require plenty of nourishment. Finest blooms are obtained by applying this Fertilizer immediately after Pruning. The essential plant foods are supplied in correct proportion and form. Use ½ lb. to each tree or bush. Full instructions sent.

PRICES (in bags):	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**5/-**	**8/6**	**14/-**	**24/-**



CATALOGUE FREE

Readers are invited to write for a free copy of Fisons' Catalogue, which contains much useful information concerning the feeding of Flowers, Fruit, Vegetables, and Lawns, together with details and prices.

Specialists in Garden Fertilizers and Lawn Renovation

16A

to add anything to a garden so ultivated and so rich as that you idered celebrated.”

gain, in the following year, on April writes :—“ At the same time that I you the enclosed copy of a resolu- the Council, allow me to remind you ear approach of the first Exhibition in the gardens of the Royal Botanic which will take place on Tuesday, instant. I am the more bold to do nembering that your late gardener, de, last year took the highest single given by this or any other society llection of plants, and I feel assured would be sorry if by some chance sent gardener should be deprived of the opportunity of showing that the splendid collection you have so carefully reared is more than ever capable of producing plants superior to any that can be brought into competition with it. Such was the effect produced last season that those Members of the Royal Family who honoured the gardens with their presence expressed great admiration, and I trust your name will ever stand at the head of the list of contributors to the exhibition of plants in the Regent's Park.”

The glories of Ealing Park, of Chiswick, and of Gunnersbury have departed, but the chariots of their successors in the Welsh Hills, on the Solent, and under the walls of Windsor Castle still churn up the Olympic dust.

Answers to Queries

—Queries and answers are inserted in ILLUSTRATED *free of charge if corre- follow these rules: All communications clearly written on one side of the paper d addressed to the* EDITOR *of* GARDENING ED, *Bouverie House, Fleet Street, London, Letters on business should be sent to the The name and address of the sender ired in addition to any designation he ire to be used in the paper. When more query is sent, each should be on a piece of paper; the name and address lded to each. As* GARDENING ILLUSTRATED *sent to press some days in advance of queries cannot always be replied to in the immediately following their receipt. We do to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

Naming fruit—*Several specimens in different stages of colour and size of the same kind greatly assist in its determination. Single, unripe, or deformed specimens are difficult to name. We do not undertake to name more than four varieties at one time.*

GREENHOUSE

as amazonica

briber, Esher).—The Eucharis is ily a stove plant—that is, it needs, at minimum temperature of 55 degs. he winter months, and if it be re- o bloom early in the year a night ure of 60 degs. to 65 degs. with a degs. during the day must be main- A suitable compost, when repotting sary, is two-thirds of good fibrous one-third of leaf-mould, with a dmixture of charcoal in pieces about of a Hazel Nut, and plenty of coarse But, in the case of established plants, is seldom necessary—they may re- the same pots for years and continue health. Drainage must be very for excess of moisture leads to il, and sourness is fatal to the During summer a moderate of shade is desirable, and at that house in which they are grown may allowed to run up to 80 degs. or 90 ome very good growers prefer to he pots in bottom heat, but this is by ens necessary. After flowering, the ay be kept cooler in order to rest t the bulbs must not, unlike many e dried off or failure will follow, for haris is essentially an evergreen

st glasshouses

C., Dartford).—Philip Miller, in his ners' Dictionary” (6th Edition), pub- ecember 15th, 1770, frequently refers ove and other glasshouses, the glass time being Muscovy glass. It would, , appear to be about the middle of teenth century that the first of these were built.

fibre failing

).—The failure is obviously due to that the bulbs were placed in the hot al in which the fibre would, naturally, uickly, with the result that the bulbs come “ blind.” Although the fibre pear to be sufficiently damp on the yet it may have been dry at the and when fibre becomes dry at the centre it is practically impossible to re-moisten it. After potting, all bulbs ought to be plunged out of doors in a bed of ashes or of sifted soil until roots are formed. It is hopeless to endeavour to force bulbs of any kind until the roots are so far advanced that they will support the growing plant, a fact which amateurs are inclined to overlook.

Fuchsias

(T. H. H., Warwickshire).—There is a wide selection of the various forms of the Fuchsia, and individual taste must, necessarily, be the ultimate ground of choice. Four good double varieties can be recommended in Frau Emma Topfer, a fine old variety with a very large corolla of pinkish-white, deeper toward the base of the petals. The sepals are coral-red and, in common with many other double Fuchsias, these do not appear of sufficient size for the large corolla. Phenomenal produces very large blooms. The corolla is of a deep violet colour marked with rosy-crimson at the base. La France has large, well-reflexed sepals and a distinct, tinted corolla which is often described as blue, and though a long way from that colour it is a very distinct shade. Comte Leon Tolstoi is a notable variety, its closely packed corolla being of a deep purplish-blue without markings of any kind. The habit of the plant, too, is very good. Four good singles would be Rose of Castile (purple corolla), Arabella (sepals and tube white, corolla rosy-purple), Mrs. Marshall (scarlet corolla), and Annie (corolla rose). Four drooping varieties might include Sunray (variegated foliage), F. procumbens, Molesworth (double, white corolla), and Mrs. Bright (single, white tube and corolla).

Oleander

(G. G., Bucks).—The buds from last year must by no means be cut off. The Oleander will only flower in a satisfactory manner when the plant is rather “ leggy,” and if you cut these buds off you are not at all likely to have blooms this year—nor, indeed, next year either. Oleanders are not difficult subjects when planted out as yours is, but it may be necessary to see that the drainage is free, and a little top-dressing annually is recommended.

FLOWER GARDEN

Dahlias

(“ Ambridge ”).—You do not say whether you possess a greenhouse or not, but if you do the Dahlias should be put into boxes together with a little leaf-mould or soil and stood on a stage therein. If kept just moist young, strong shoots will quickly form, and these, taken off when about 3 inches in length and with a small portion of the old tuber attached, and potted up singly, will make excellent plants for placing in the open in May. Such plants produce finer blooms than old specimens. If you have no greenhouse, then divide up the old plants, leaving a living growth to each piece, and plant out in the open direct. This, however, should not be done before the end of April.

Shamrock Pea (Parochetus communis) wanted

(G. S.).—Seeds are offered by Messrs. Thompson and Morgan, seedsmen, Ipswich.

Plants and shrubs rabbits avoid

(N. B.).—It is an undoubted fact that the taste of rabbits varies in different districts, but a fairly wide experience results in the following list of plants which have not been attacked by these pests:—Bulbs of most kinds, Primula denticulata, Veronicas, Alstroemerias, Pyrethrum uliginosum, Tritomas, Trilliums, Foxgloves, Saxifrages of many kinds, Pæonies, Doronicums, Anemone fulgens, Silene Schafta, and all the Polyanthus family. Among shrubs may be mentioned Rhododendrons, Azaleas, Philadelphus Delavayi, Leycesteria formosa, Ribes of varieties, many Maples, and, of course, Laurels. But, as has been said, the tastes of rabbits vary in different districts, owing, no doubt, to the available amount of the ordinary herbage, which forms the principal food of the rabbit. During hard frosts they will attack shrubs which, at other times, they leave severely alone.

TREES AND SHRUBS

Box hedge

(W. R. J.).—Box, as a rule, has very thick masses of fibrous roots and may, therefore, be transplanted with considerable ease. Planting may still be done, but it should not be unnecessarily delayed, and dull and open weather should be utilised for this purpose. Prepare the soil well, adding plenty of half-decayed leaf-mould and a little sand. As you desire a light rather than a dense hedge, planting may be done at a distance of 2½ feet from plant to plant, using plants 1½ feet to 2 feet in height, although, of course, larger plants can be used if desired. It will be necessary, at first, to trim in the shoots to some extent in order to promote growth, and if the weather be dry after planting watering ought to be done for a time. Box hedges are easily established and easily managed, more especially when they are allowed to grow, practically, in a natural manner as you propose to do.

Climbing plants for arch

(E. L. B., Kent).—For such a favoured position Wistaria sinensis naturally suggests itself. It is ornamental alike when in bloom and when its handsome foliage is at its best. In such a position, too, it might conceivably bloom twice in the course of a season. Forsythia suspensa, too, would be a good plant for the purpose indicated; Lycium barbarum, Aristolochia sipho, Celastrus scandens, Clematis Flammula, or one of the many charming Honeysuckles would afford alternatives. Possibly in your district Solanum jasminoides would succeed, and nothing is more effective. If you desire something quite "uncommon," Menispermum canadense or Periploca græca may be recommended. Both are very pretty, indeed, if not exactly strikingly handsome, but P. græca ought not to be planted in the neighbourhood of the house, as some people object to the rather pronounced odour of its small velvet-brown flowers.

VEGETABLES

Retarding Chicory roots

(G. Sewell).—About the end of March the roots should be lifted and plunged either in soil or fine ashes on the north side of a wall, the crowns being buried about an inch beneath the surface. This will check the growth considerably and should enable you to provide a supply during the desired period. Also when preparing the roots for blanching place them in a cool room instead of a warm one, or under Rhubarb jars in the open, and in the coolest place you can provide.

MISCELLANEOUS

Black Mulch paper

In the issue of "The Scientific American," August, 1928, pages 122, 123, and 124, there appeared an article *re* Black Mulch paper for crops, made in U.S.A. in rolls. It was experimented by the U.S.A. Department of Agriculture, and remarkable results were apparent. In some crops the increase is really wonderful, as much as 691 per cent. increase in Sweet Corn, and in Carrots 507 per cent. Other crops, too, showed a great increase, notably Cucumbers, with a 512 per cent. increase. Has anyone amongst our horticultural readers heard of this? I should like to know if they have or if they have tried the paper, and if and where it is procurable in this country. INTERESTED.

[We understand that the experiments to which you refer were very successful in the States, especially on soils which are liable to dry out rapidly under drought conditions. We have no record of the paper being used in England, but we are publishing your letter in the hope that if the paper has been used here our readers will give you the benefit of their experiences.]

Lawn sand

(D. B.).—The correct time to apply lawn sand is just as the grasses are beginning to make new growth. Repeat the dressing as often as is necessary to kill the weeds. It is important that the lawn sand remains on the weed foliage as long as possible before rain washes it off. Please see reply to "F. M. G." on page 192 of our issue for March 16th as to the method of making lawn sand. If you do not want to go to the trouble of making your own mixture you should consult our advert. columns for a good lawn sand, which should be applied according to the maker's directions.

Soil samples

(Woking).—We have examined your three samples of soil and find that they contain a fair reserve of lime, so that your crop failures cannot be due to soil acidity. From the samples received it appears to us that your garden is short of organic matter, and this should be applied in the form of short, well-rotted farmyard manure. Further, the soil is short of available phosphate and potash. For the present you could make up this deficiency by applying a mixture of three parts superphosphate and one part sulphate of potash at the rate of 4 lbs. per square rod. Next autumn you should apply an equal mixture of basic slag and kainit at the rate of 3 lbs. to 4 lbs. per square rod. A system of manuring such as outlined above, *plus* a fairly generous application of farmyard manure, should put things right. If you apply calcium carbonate as suggested in our previous reply once in each three years you should be able to keep the lime content of your soil in good condition. The Rose specimens have been examined, and there is no sign of fungoid trouble. The recent spell of cold weather is responsible for their appearance. We think that, although the plants have had a considerable check, they will break again.

NAMES OF PLANTS

Persistent.—Ruscus hermaphroditus. This unusual plant may be obtained from John Scott and Co., The Royal Nurseries, Merriott, Somerset.

CATALOGUES ON ORIGINAL LINES

"Bunyard's Best Six, a Selection of Fruit and Flowers for Amateurs," published in the interest of the connoisseur and the busy man. George Bunyard and Co., Ltd., Royal Nurseries, Maidstone.

"Herbaceous and Alpine Plants," with brief descriptions as near accurate as may be hoped for. Gullicks, Waterloo Nurseries, Salisbury.

"Hardy Plants," advanced copy. Alpines and hardy plants described in original and literary style, illustrated with over 100 line drawings. An interesting, instructive, and even humorous catalogue. Gavin Jones, Letchworth, Herts.

PUBLICATIONS RECEIVED

"Seed Testing," by John Stewart Remington. Useful to gardeners, farmers, and agricultural students, who can easily apply the up-to-date methods described. Published by Isaac Pitman and Sons, Ltd., 10s. 6d.

"The Rose Annual, 1929," including a full report on the International Rose Conference, with beautifully coloured illustrations and numerous articles more welcome than ever. Published by the National Rose Society, 28, Victoria Street, S.W. 1. 10s. 6d. to non-members.

Manchester and North of England Orchid Society

AT the meeting held on Friday, March 15th, 1929, the members of Committee present were Messrs. J. B. Adamson (in the chair), A. Burns, A. Coningsby, J. Evans, A. Keeling, D. McLeod, W. J. Morgan, and H. Arthur (Secretary).

AWARDS OF MERIT

April 5th, 1929, at the Houldsworth
and on Thursday, April 18th, at the
Hall, Manchester, in conjunction w
spring show of the Royal Botanic
Horticultural Society of Mancheste
Northern Counties.

H. ARTHUR, Secre

The Soldanellas (Moonw

These diminutive Alpine perennials
tractive little plants, inhabiting ver
altitudes on the great mountain-ch
Europe. Soldanella alpina is a mos
esting plant, and is found growing n
snow-line, where it receives a plentif
ply of moisture from the melting sn
essential condition in its welfare.

The genus is a small one, comprisi
three or four species, particularly suit
growing in the small rock or Alpine
A situation at the base of the rockery
be selected for them in partial sha
where they will obtain an ample su
moisture. S. alpina has beautifu
bluish, pendant flowers, bell-shape
deeply fringed, three or four on a stem
3 inches to 5 inches high. The lea
roundish and bright green. S. mont
the largest species allied to S. alpin
larger in all its parts; in all other res
is similar, and needs the same treatme
minima is a very small plant with
thick round leaves and purple-c
flowers produced singly on a stem
1 inch high. S. Clusii is rather small
S. alpina, but is otherwise similar, w
exception of its flowers, which are pu
colour. There are several varieties i
vation, including S. Wheeleri, a whit
of S. alpina. All the species succee
soil of a vegetable character, such a
and leaf-soil, to which a liberal quan
sand is added. Precautions should be
against slugs. Sand spread arour
plants occasionally is often very use
warding off attacks.

Once the plants become established i
able quarters they make appreciable g
but they should never be allowed to
from the lack of moisture. They m
propagated by division of healthy pla
the spring, or raised from seed. The
Soldanella belongs to the natural
Primulaceæ, and the flowering perio
the spring, March to May.

Ryders
and the
VEGETABLE FAMINE

Owing to the severe frosts, gardens everywhere are absolutely denuded of vegetables, and a vegetable famine is with us. The same thing applies to flowers. Millions of Perennials and Biennials have been destroyed.

Ryders have prepared a brief, practical group of suggestions which are embodied in a pamphlet. This shows in simple language how gardening people should proceed now to remedy this disaster. A Copy is included in every order sent out.

If you desire to have the pamphlet or catalogue, or both, whether you are a customer or not, please send postcard to-day, stating which you require, and we will send same by return.

Kindly mention this paper.

Owing to the hard frost and the late season there is still plenty of time to sow your seeds. Order now from Ryders.

Taking Them Round the Garden

I, yes! do come round (I know I shall ate taking you). Our first halt is in ont of the Daphnes Mezereon—or pne Mezereum, as you like it. They are good this year, fat branches of blossom as thick as Hyacinths and in several ious shades of creamy-pink. The day is he sun warm, and the smell—*pace* the eginald Farrer, who did so loathe it—nly. After some silence one of them s, flatly, "They *so* well at my old n" (Why cannot ay they *are* nice, ty *smell* nice?)

et, we stop where been slaving at icas for years and The soil here is ny for the lovely g, so we had to their beds with iggings and many et and blankets of ould, rotted cow e, and imported These delicacies ways seized upon iately by a quantity f vile Elm roots, the dendrophilic cies of the gar- master will not of the brutes be- removed, and cal searches and s have to be altogether a t deal of trouble e well rewarded by pink and pale single things ning on their stems. I have a great many but they always behind, both s and angulosas, ing-slower to h and more than the blue nk ones. The s are very hearty, especially the pink hich has still got its last year's leaves, d bronzy, in wreaths around its mass ers.

got quite excited here and said: we've seen these in sheets and sheets, all over the place in Mrs. ggreen's They were quite pretty in the *she* had!"

we moved past the small pond. I like to say *how* small it is, but it is sweetly adorned on one bank just now by a very thriving clump of Narcissus minimus.

"Is that the common wild Daffodil?" they asked, with sprightly interest.

Next came Primula Sibthorpii, that sweet, merry lilac person with the bright yellow eyes (and if you do not say this is pretty I shall murder you).

They did not say it was pretty. Neither did they say the first of the Anemones, fulgens and Scythinica, and some very pushing but all the more welcome St. Bavo's in pink and rosy frocks were pretty, but they began very long-complaining accounts of how certain Anemones, which I gathered were Coronaria, because they got them from Geashill, would *not* do in their garden.

I did think Scilla sibirica alba would, perhaps, draw a word of praise. It is so very nice, and you do not see it everywhere. But all they said was that they had not seen it before.

Tulipa Kaufmanniana

A glorious species, and the first of all Tulips to flower. Flowers soft shade of creamy white flushed deep orange in the centre, coloured externally with red

And so I hurried them off, not with any gifts as Mr. Bowles does, because I am not good like him, and kind and generous to those who—who—well, who have not made me feel I like them very much indeed.

But they caught sight of a great find I had had recently; a wild flower, it is true, and a very common one, but quite double instead of single, and quite double the ordinary size. And they said: "What on earth do you want to put that in a pot for? It is all over our garden, being weeded up."

I must add a wee little bit, though it is nothing to do with the garden, except that there are flowers on the cups and saucers and plates. We had a new breakfast service and a visitor. We were simply bursting with the pleasure of the new service, and had spent quite a lot on it, because we thought it so very pretty, though too expensive.

"Oh, yes! *very* like ours," said the guest. "I wanted something cheap, so I got it at Slump's the other day."

I cannot sign this, can I, except, perhaps,

NIL ADMIRARI.

Abutilons

These handsome foliage and flowering plants which once enjoyed great popularity as greenhouse subjects for some reason fell out of favour. They, however, are so attractive as to warrant a word of commendation on the arrival of spring. Their cultivation is not difficult for an amateur. They require a temperature of 45 degrees to 50 degrees in winter and from 55 degrees to 60 degrees in summer, and a compost of two parts old loam, one of peat or good leaf-mould, and sand with ample drainage. The orthodox way of propagating Abutilons is to take cuttings of partly ripened wood after plants have bloomed, inserting them in pots of silver sand, and plunging the pots in a hot bed in spring, or to place them on a shelf near the glass, where they can be shaded for a time until rooting takes place. Old plants need to be cut back in February or March. Young struck plants should be pinched once or twice to encourage a bushy habit. Another method is to sow seed in pans of light sandy soil in a genial heat in spring, and grown on, they will make serviceable plants and bloom the following year. Where it is desired to use them as wall coverers inside a house they should be planted out in a bed. Copious supplies of water must be given in summer and syringings with tepid water several times a week will greatly help, and do much to thwart the attacks of Red Spider.

MIDLANDER.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Longevity of Yews

WHEN looking over some old catalogues and guides of trees and shrubs recently, I same across the following in the "Foresters' and Planters' Guide" for 1907-8, published by Clibrans, Ltd., Altrincham. I thought it might be of interest to readers of GARDENING ILLUSTRATED :—

"We have not to cross the Channel, writes Sir George Birdwood in the 'Times' to find trees of a standing long prior to the date of St. Luke—the Yew trees of Braburn, Kent, being 3,000 years old; Darley Churchyard, Derbyshire, 2,096 years; and Firtingal, Aberfeldy, Perthshire, 2,500-2,600 years, while other long-lived British Yews are those of Crowhurst, Surrey, 1,400 years; Fountains Abbey, Ripon, Yorkshire, 1,200."

J. LODGE.

An avenue of old Yews at Copped Hall, Essex

The late Mr. J. Mayne

It was with genuine regret that I read of the passing away of Mr. J. Mayne, whose kindly and modest contributions won for him the friendship of gardeners the world over.

I would appeal to the older and experienced gardeners who read GARDENING ILLUSTRATED to send in articles such as Mr. Mayne wrote. What to them may appear commonplace is infinitely more valuable than any extensive commenting on any special subject, and is read by those who need experience and confidence.

I sincerely trust that there will be others who will continue with the same good work which Mr. Mayne did, as many of us in foreign lands look to British gardeners as the source of our inspiration.

A YOUNGER GARDENER.

Oakland, California.

Daphne Laureola

In your issue of January 26th, 1929, is an article by H. Stevens on the "Early-flowering Daphnes," an article which, to my thinking, fails grievously to do justice merits of D. Laureola. But this neg so universal that I am in doubt wheth own experience with the plant is pecul not. I enclose a specimen from a se grown in my garden from seed shed d or indirectly by a plant collected in this bourhood, for, though not common abouts, it is a well-known plant in this Now, at this season of the year, from 8 p.m. onwards my garden is filled delicious Primrose scent from plants Laureola. Personally, on a still ever have often smelt the scent of this plan distance of 30 yards. Yet, in his articl H. Stevens gives no merit to this pla yond that of evergreen foliage, for whi the way, it makes me pay dearly by sh its yellow leathery leaves in summer. try the scent of enclosed in a room at 9

JOHN S. GAY

Hall Cottage,
New Earswick, York.

[Although we can detect no smell sprays sent, we can endorse all that our spondent has to say in praise of the re ing spring-time odour of Daphne La when in bloom. It is one of those de odours like the smell of the little cr cones now to be found on the Larch tha be picked up many yards away fro plant.—ED.]

Primula Florindæ

A plant worth growing

At this season all lovers of plants the look-out for something new. P Florindæ, of comparatively recent int tion, is certainly one of the finest hardy introduced since the war. It is adapta many uses. To be seen at its best it be planted in large groups associated Willows, Astilbes, etc., by the side of or stream. It is also at home in th baceous border planted in groups of th more on the shady side of some talle jects, preferably of a shrubby nature. also be used with a most pleasing effec cut flower mixed amongst other flowers of a delicate shade, and mas the lower parts of the rock garden it mands the attention of all.

This is one of the hardiest and grown of all Primulas. Seed sown no make nice plants to put in their perm quarters in the autumn. Like most strong-growing plants, it succeeds bes deep, rich soil. A liberal supply of far manure, leaf-mould, and bone-meal, plenty of water during dry spells, will a magnificent display of tall spikes of s scented yellow blossoms during the late of summer and autumn. TEVIOTS

Primula Bulleyana

With reference to Primula Bul (page 199), I think the majority of p day P. Bulleyana are very inferior form result of not selecting and re-selecting year. A good form of this Primula i worth growing, especially in large mas moist woodland. It is no use saving from the best plants only. All inferior must be ruthlessly scrapped before th fluence the best forms with their pollen hybrids mentioned by F. H. Fisher I t be those of P. Bulleyana and P. Bee If the former is the seed parent, the colours will give a majority of yellow-o copper-red tints, and if the latter is th parent, pinks, rose-carmine, and mauve predominate.

The salmon tints referred to as bein my strain of P. pulverulenta, unfortu unlike this plant, do not come true. N the hybrids do, and many of them are As to the colour of P. Bulleyana, spe rn memory, I think the best description v.ld be apricot-yellow, with the buds hving a deeper shade. If this species is a:fully selected I am sure it is well worth .ace in our garden. From what I know f'. chungensis I think P. Bulleyana is a eer garden plant, and I find it as adapt-h as and more perennial in our gardens n P. Sikkimensis and P. microdonta, and sorms. I have young plants of P. Bulley-n Ward's Variety. It came to me as such, lch is, I believe, a better form than the r.inal one. G. H. DALRYMPLE.

— Mr. F. H. Fisher evidently thinks 'rnula Bulleyana better kept out of the alen unless we tolerate it (and its other a:nt, P. Beesiana, which probably even ne people would exclude) for its beautiful hlren that flower after P. japonica and P. uerulenta are past. Considered by itself ny would agree, but it may be beautiful n't suitable setting. Put it (or let it put sf) among Japanese Irises, for instance, the pond side, and there will be little a:e to discard it from there. F. J. C.

Primula farinosa

am grateful to " J. R. K." for his notes our issue of the 23rd ult. In his successes es, indeed, thrice blest, as, since my previ-u note, the prolonged and record frost in , one of the most exposed spots of the l lands, appears to have worked still :her havoc among my plants of Primula nosa, and has also struck a hard blow uch true Alpines as Dianthus alpinus and .ieglectus, while such treasures as a batch f Meconopsis quintuplinervia, many Alpine rnulas, and Cushion Saxifrages (except S. l:ina) look healthier than ever, the last dry e:od of seven weeks having forced them to nain dormant as in Nature.

'here is still a further query I have to ai: about P. farinosa, and would be glad if none could throw any light on an interest-:spoint—what is P. farinosa Craven Gem? r would assume that this variety origi-ad in Farrer's Craven Nursery, as one of is Aubrietia hybrids was named Craven n, but no reference has been found in his t works, and apparently the name has no uiority.

'hether the plant is of English or Con-nntal origin is obscure, and exactly where ffers from the type is doubtful.

'r. Sangster, of Messrs. Thompson and l:gan, tells me that it has been grown at wich for several years, though the source f upply is unknown. The form—there at :—is a much better perennial than the I, and flourishes near a small pond in e'y soil, where it has been for a few years. le than that he dare not state in case, n taking stock this spring, it is found ngst the departed.

am inclined to think that altitude, as sug-e:ed by " J. R. K.," has something to do i the longevity of P. farinosa, and that kswollen crowns induced by the softer con-it ns of a southern summer are unable to :d the damp and cold of the winter.

'ne more point. Does " J. R. K." con-d that individual plants in their wild state 'orkshire are generally long-lived? My rvations would point to the contrary.

F. H. FISHER.

Snowdrops at Burford

a recent issue of GARDENING ILLUS-R'ED you were good enough to publish the l wing note :—" Thanks to the kindness f Ir. E. A. Bowles and other good friends n now growing Snowdrops bearing the a es set out below, and would be glad to in, by purchase or exchange, any other ns that may exist :—

" Atkinsii (Painswick Churchyard), Allen's Seedling Byzantinus, Byzantinus November, Caucasicus, Cilicicus, Elwesii, Elwesii Balkan form, flavescens, Fosterii, Galatea, Icariæ, Imperatii Boyd's Long, Imperatii Twin Flowers, Lady Beatrice Stanley, latifolius Allenii, latifolius azureus, latifolius Wisley Form, latifolius Glasnevin Form, Magnet, Melvillei (Dunrobin), Merlin, Montgomery, Mrs. Backhouse No. 7, Murielæ, neapolitanus, Neil Fraser, nivalis (double yellow), nivalis Ewbank, nivalis (late-flowering form), nivalis (no green spot), nivalis Sir Herbert Maxwell's Variety, Olgæ, plicatus Boyd, plicatus Burford Variety, plicatus flore-pleno, poculiformis, Sharlokii, Straffan, Valentine, viridapice, viridapice (white form), Warham."

Of these Straffan has disappeared, but I have some hope of getting it from Ireland. " Murielæ " should be " Rachelæ," " Murielæ " not being in cultivation. Mrs. Backhouse No. 7 has also left me, but see below. Thanks to the kindness of Mr. William Robinson, Lady Moore, Mr. J. C. Watt, Mr. P. H. Thompson, and others I have added the following to the collection :—

Geranium Farreri, flowers of a delicate Apple-blossom tint, with black anthers

Backhouse's Best, Brenda Troil, Cassaba, Corcyrensis præcox, Elwesii J. C. Watt's hybrid, Green Snowdrop, Icaria, Imperatii Bitton, Iris, Latifolius Gravetye Mocca's Variety, Red Head, St. Mary's Abbey, Whitallii, besides three unnamed forms from Gravetye and two from another source. Icaria (Gravetye) is quite different from my original Icariæ, a latifolius variety. Corcyrensis præcox flowers in October and November, Iris is a little like Magnet, but has the three inner segments of the perianth deep green. Owing to the frost many of the Snowdrops are short in the stem. Atkinsii is very fine, producing many flowers with four outer segments, and Allen's Seedling is the size of a pigeon's egg.

In conclusion I may add that three friends have promised me further varieties, including one said not to flower until June, and I hope they will materialise.

Burford. WILLIAM LAWRENCE.

Geranium Farreri

FOR those who desire a plant which is neat in habit, charming in appearance, beautiful in flower, and at the same time large enough to be seen without danger to trousers knees, a long way would be trod before they could find a plant better than Geranium Farreri.

Discovered by the late Reginald Farrer in 1915 in Western China, Geranium Farreri is as robust in constitution as any other hardy Geranium.

Originally collected at 15,000 feet above sea level, it seems quite satisfied in Sussex, setting a fair crop of seed last year. The plant never exceeds 6 inches, even when in flower. The flowers are an inch and a half in diameter, and are of a delicate Apple-blossom tint, while the bunch of stamens in the centre of the flowers bear black anthers, making a striking and unusual contrast. They are borne on 2-inch to 3-inch stems, and nod gently to every breath of wind in a charming manner. The flowering season is from the end of May to mid-June, and then on and off until autumn, when the leaves change colour and gradually die down.

Associated with the golden Calochortus amabilis, Geranium Farreri is exquisite, although personally I prefer to see the plant isolated, showing its quiet charm against a mossy rock, without disturbance from other competing beauties.

Any position seems to suit this plant, though perhaps it is at its best on a cool exposure, while adequate drainage always repays itself. Gritty loam suits its needs perfectly, and, once established, this Geranium will be a joy for ever.

Sharpthorne, Sussex. REGINALD KAYE.

Amherstia nobilis

FROM THE HON. LADY CECIL, C.B.E.

I have read with much pleasure the articles by Sir William Lawrence about his grandmother, Mrs. Lawrence, especially her triumph in flowering the Amherstia nobilis. It may interest your readers to know that my father, the late Lord Amherst of Hackney, was given a plant, a young one that had been sent to Kew, in the early eighties. The one at Kew was then in a poor state from overcrowding and did not flower. My father built a special house for it in the gardens of Didlington Hall, Norfolk, with a double glass roof and two tanks to give the requisite moisture, in which we grew blue Nympheas. It flowered beautifully for the first time in 1887, and Queen Victoria graciously accepted a bloom.

The plant was first discovered by Dr. Wallich in Burma in 1827, and named after Countess Amherst, wife of William Pitt, second Baron and first Earl Amherst, who was Governor-General of Bengal, 1822 to 1828. When the tree flowered at Didlington I photographed a son of Dr. Wallich sitting under it. For the following 19 years the tree flowered every season from January to March. I have an oil painting which I did in the early nineties of a flower, natural size, when there were 50 blooms. Having now seen it at its best in Ceylon I can appreciate what a good specimen my father had of this magnificent tree.

It is not easy to cultivate even in the tropics. The tree at Buitenzorg, Java, was a poor specimen; the fine old tree at Singapore is dead. Those at Peradenia, Ceylon, are a wonderful sight in January, clothed in immense scarlet showers of bloom. Each spray, with some 20 flowers, measures about 2 feet 6 inches by 18 inches, and the tree, of 30 feet to 40 feet, is covered with them. I have not got my notes to refer to, but I think it was in March, 1887, that I wrote an account of the Amherstia in "The Garden."

ALICIA M. CECIL
(*née* Hon. Alicia Amherst).

Luculia gratissima

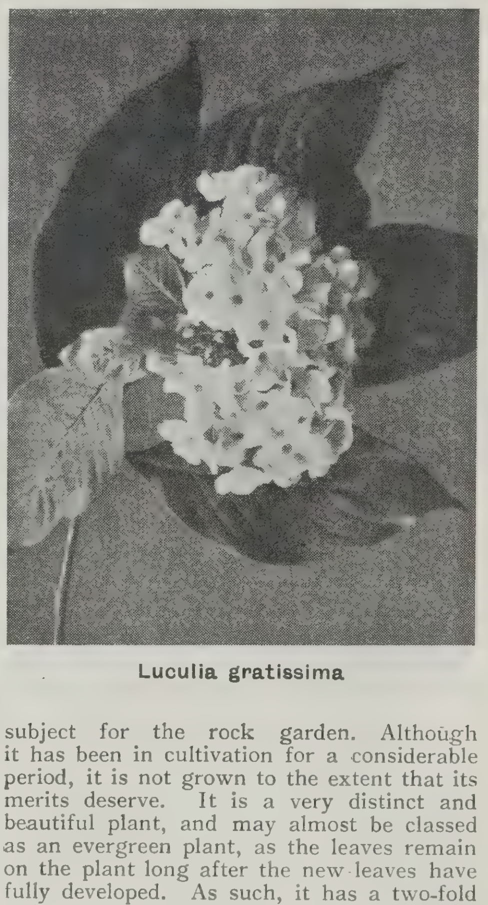
WHO may possess the temerity to name the loveliest plant? And yet have I often gazed upon the clear pink blossoms, deliciously fragrant and clustered at the extremities of richly-leaved branches and named it perfection. The flowers are of clear, shimmering, satiny pink and slightly fleshy in texture, the green leaves ample in size and deeply coloured. The growth of this shrub is upright and strong—it is an ideal subject for planting out in the border in a cool greenhouse or conservatory; it enjoys a mixture of three parts loam to one of peat, with a liberal sprinkling of sharp sand, and the drainage must be thorough. Established plants should be cut hard back after flowering, as the young growths will produce flowers the next autumn, and during winter very little water will be required; during the growing season, however, copious supplies of water must be forthcoming, and drought is possibly a cause of the bud-dropping, to which this plant is prone. This Luculia may be grown and flowered successfully in pots, but as a specimen planted out, its beauty will be fully realised. A native of the temperate Himalayas, it came to us in 1823, and was followed, in 1843, from the Khasia Hills, by L. Pinciana, a white and deliciously-scented species. RALPH E. ARNOLD.

Erysimum pulchellum

One has to write of Erysimum pulchellum with some reservation. It is one of the subjects which is attractive at certain seasons, and even at all seasons in some gardens, but fails to maintain its reputation in other places where it grows too strongly. Farrer tells us that it grows from 1 foot to 2 feet high, but with me it never attained even the lower stature he mentions, and at no time has it reached more than 9 inches or so. Farrer qualifies his statement of height by saying that "it can also earn its name for daintiness by not exceeding 2 inches." It should have poor stony and sandy soil to keep it dwarf, as when it is at its full height, which is when it flowers in spring, there is a look of lankiness about the plant through the stems being rather long for the size of the heads of flowers they carry. The foliage is quite pretty, growing into a mat or carpet of rather spoon-shaped, toothed leaves rising but little above the ground. In spring the bright orange-yellow flowers are raised above this mat and remain for a considerable time in bloom. In autumn, if the first flower stems are cut away, a smaller number of flowers are produced. These are practically stemless, and then the plant looks much better than in spring. There are several forms differing little except in the form of the leaf, which in the type is toothed. E. pulchellum is readily raised from seeds or increased by cuttings. S. ARNOTT.

Galax aphylla

This little North American hardy herbaceous perennial is a most charming subject for the rock garden. Although it has been in cultivation for a considerable period, it is not grown to the extent that its merits deserve. It is a very distinct and beautiful plant, and may almost be classed as an evergreen plant, as the leaves remain on the plant long after the new leaves have fully developed. As such, it has a two-fold claim to popularity, and one would expect to meet with it more frequently. Its cultivation, though not difficult, may be partly responsible for this. It delights in a damp situation, a vegetable soil, and slight shade.



Luculia gratissima

The small white flowers, which are fairly numerous, are borne on slender naked stems, 12 inches to 18 inches high, in a comparatively dense spike, several inches long. The leaves are heart-shaped, nearly round, evenly toothed, veined, and somewhat leathery in texture; they are also smooth and rather shining. The colouring differs at the different stages of growth, the new leaves being pale green, assuming beautiful tints of reddish or scarlet hues, as they become older. This finely-tinted foliage is supported on roundish wiry stems, which, during the autumn, take on a highly polished surface. The general habit of the plant is very neat and pleasing. It flowers in
and August, the bloom lasting in good
dition for some considerable time.

As regards its treatment and cultiv
a position should be selected, when
templating planting, combining slight
and a cool damp soil, avoiding all ten
to sourness. A situation at the base
rockery in a recess formed by large st
depressed a little below the natural g
level, would prove an ideal position fo
plant; the stones would then combine i
viding the necessary amount of shad
quired. A compost of nearly all lea
to which a small quantity of good loa
charcoal is added, together with plen
moisture at all seasons, suits this plan
mirably. The charcoal is helpful in ke
the soil sweet. An annual top-dressi
this latter material will also be found
very beneficial. Propagation is
effected by division of healthy, well-g
clumps in the autumn. The clumps s
be lifted complete and thoroughly s
out, when the crowns can be readily p
replanting them separately under s
conditions to those mentioned above.
common name for this plant is "The
Plant." J.

Rose Rêve d'Or on cottage

The Individual Treatment of Roses

I.

Recently it was suggested in these columns that of all the articles, catalogue descriptions and hints, and other contributions to the culture of the Rose, upon which the enthusiast largely relies for his guidance, hardly any ever mentioned the necessity for individual knowledge and treatment, and that in the few cases where this most essential point in really successful culture was noted, very little, if any, information was given as to what this or that particular Rose required in order to give of its best

UBTLESS the frequent failure to ealise the importance of this detail in ultivation is responsible for much of sappointment which is experienced over haviour of certain Roses, both "old" new." It is equally probable that the ature" of the Rose, as a whole, tends duce the impression that so long as one minates between Teas and Hybrid Teas, wen Hybrid Perpetuals and Pernetias, on, one need go no further in know- or practice in order to obtain the best s of which particular Roses are capable. true lover of the Rose, who hesitates ard even the least satisfactory of all he until every possible chance has been red towards the improvement of its ution, will quickly discover that merely criminate between Hybrid Teas and uals and so forth is altogether insuffi- To regard and to treat this or that s" of Rose *en masse,* as it were, as ight treat a bed of Intermediate Antir- ns of various colours, is wholly in- qate in the attempt to attain any con- standard of excellence. To the keen an the bald generalisations that Roses oss feeders and require a rich adhesive and that the Teas must be more lightly than the Hybrids, are but half-truths thy the term "cultural hints" in the gement of our most exquisite and popu- wer. To him each and every Rose is lass unto itself, an individual, and, as reveals particular inclinations and re- ents, and responds to personal, ex- study and care in details of treatment. s direction, it may be added, it is clear e grower of a mere score or two may "rosarian" equally and truly as he unts his trees by the thousand.

with the idea of emphasising such that these brief notes are contributed. That they have no pretensions to being exhaustive or even comprehensive will be readily apparent; to attempt to deal individually with all the better-known Roses alone would probably require a lifetime of experiment and experience, and the conclusions occupy at least a volume. They represent merely the gathering together, in no sort of order or classification, of a heterogeneous collection of notes jotted down as occasion offered, the results, in plain and simple form, not of extensive reading on the subject nor of hearsay, but of more than 20 years' personal practical experiment and experience of Rose culture on the lines indicated above. If they are in any way informative to some, suggestive of further experiment to others, provocative of amplification at the hands of those of more lengthy experience, so much the better for the Rose and for the grower.

Only the other day, in these columns, a correspondent said that "with the treatment on which almost all other Roses thrive Mabel Morse sulks." Precisely! And so long as this Rose is given the treatment on which most Roses thrive, it will continue to disappoint, as I have noticed it so often does. No manure, natural or artificial, but a soil uniformly, consistently, and decidedly moist, will establish this Rose as one of the last to be discarded. Florence L. Izzard may be bracketed with the former in both the details mentioned, but in this case the result of too generous treatment seems to be the production of overmuch coarse wood, often awkwardly placed, with accompanying deterioration in quality and freedom of bloom. The delightful Golden Emblem, one of the outstanding difficulties of which is its tendency to die back badly, largely overcomes this fault if grown in a soil practically free of manure, so open as to be distinctly on the light side. And of all Roses this is the one I should prune last, never before the end of April, for if any Rose is susceptible to frost, at least in the colder districts, Golden Emblem is, and is the first to succumb. Wilhelm Kordes is another which, if it does not actually resent manure, is far better with the most sparing treatment; indeed, feeding of this Rose seems to be quite secondary to suitable pruning. Like a number of others, it is frequently pruned too hard, and the best results accrue from using the knife on it almost as lightly as one would on a Noisette.

It would seem superfluous to suggest how better to grow our old and yet most valued friend, Frau Karl Druschki. This old Rose frequently perseveres to remarkably good results under by no means ideal management. It is not, and never will be, a wet weather Rose, but we can assist it considerably by attention to one or two details; by disbudding, of course, which is absolutely essential, by—who would believe it?—giving it rather less manure than we usually do, and, equally important, by pruning far more lightly than is often the case. Though seldom seen, the ideal method with this Rose is to peg it down—so treated one would hardly recognise it. The same may be said of Avoca—the last-mentioned method apparently being the only way to obtain the freedom of bloom so often lacking in this otherwise satisfactory Rose. Still another old stager, Caroline Testout, which we have known how to grow everywhere and anywhere, for so long, and about which it seems almost ridiculous to suggest anything so late in the day, has a quite common fault, the cure for which, or partial remedy at least, does not seem so well known. In some gardens this old stager "balls" its blooms badly, but grown in the heaviest possible soil which is not actually clay a vast improvement is effected. Heavy land, too, and a

A double-flowered form of Campanula pusilla

heavy hand with the knife, appears to be the treatment most acceptable to The Queen Alexandra, of effective colouring, but unsatisfactory habit and growth. Those otherwise splendid Roses, Geo. Dickson, Earl Haig, and J. B. Clark, are invariably spoiled by distorted blooms and hanging heads. The remedy as to 90 per cent. of both faults is to peg them down and "spur." If grown as a "bush" quite light pruning gives superior results. The indispensable Hugh Dickson is also first-rate under the same treatment, and it may here be noted that this Rose, when grown as a "bush," resents anything like a sheltered position, and rejoices in exposure and rough usage. Elsewhere it tends to great excess of wood. Given really stiff, not too rich loam, and lifted and transplanted every two or three years, H. Dickson is magnificent in form and colouring. Of other older Roses Joseph Hill is undoubtedly tender under the winter conditions generally prevailing in the North, and should be given adequate protection, while the ancient but useful Ulrich Brunner should be allowed to develop into a good-sized bush, as then only will the colouring and shape of bloom be up to the standard of which it is capable. And as far as colouring goes, there is little doubt that Roses which vary, such as Sunburst, which in one garden is a really rich yellow and in the next a washed-out cream, or dirty white, do so, not only under influence of season or soil, but also of the age of the wood on which blooms are produced. It will be found that blooms of Sunburst on old wood are regularly of far deeper tint than those on young growths. Upon suitable pruning, therefore, in this case, at least, richness of hue largely depends. Fading of colour as the bloom expands is often alleged against some of the yellows, but I have never found this to be so with Mrs. W. Quin, which has, as far as I can see, as a bedding Rose, but one fault. It has a tendency to precocious growth, and is thus liable to be frostbitten badly. Therefore, late, and be it said not too heavy, pruning should be practised, and, indeed, this Rose is probably best allowed to form a bush of considerable size. As it is of very vigorous habit it can well have a little more space than is usually given. C. V. Haworth, though a Hybrid Tea, is another which is liable to frostbite, and pruning should be delayed as long as possible. F. S. Key is, to my knowledge, the only Rose which actually prefers shade, and, grown under completely cool conditions overhead and below ground, this comparatively little-known Rose is well nigh perfect. where it is sure to disappoint. The coloured Frances Gaunt and pure M. D. Hamill are two which prefer lighter pruning than is generally the similar Roses, while the popular Mr Herriot seems to gain in vigour and st of stem by sparing use of the knife. heavy land suits the latter best, but case is this Rose so satisfactory as grown as a standard with normal pru

(To be continued.)

Ononis Natrix

A noble plant when well grown flower-stems are often 2 feet in height, branched, carrying endless pairs of flowers opening successively to the ext of the stem. The stems are so thick duced that they form a dense tuft, and a shoot falls away from the closely centre it produces a fine effect. The bl are drooping in the bud. It shou planted in a sunny position in a cre small pocket between stones. This the root moist and protected from t sun, which otherwise the plant enjoys. compost should consist mainly of goo to which a good proportion of broken added, and the soil should be open to depth, as the tap root strikes deeply in ground. It is truly an imposing pla should be planted in positions where summer effect is desired. The plant fectly hardy, but objects to water ab crown for any length of time. This m avoided by planting at a slight angle to it to get away quickly.

H. Stev

Native Plants in the Garden

Now that we have such an immense range of foreign flowers to choose from it seems, at first sight, rather foolish to cultivate our native plants, and, in fact, we usually find that those plants that give us most pleasure in the countryside give us least in the garden. Wild Daffodils in a pasture are as pretty a sight as any but a farmer could wish to see, yet in the naked soil of the garden they look awkward and gawky. Wild Hyacinths and Cowslips may be downright ugly in the border, and the fragile beauty of the Rosebay Willow Herb (which is combined with an unexpected strength of character that tends to become aggressive in the garden) looks uncomfortably rustic in sophisticated company. It seems as though our choice of flowers is influenced by a feeling for the æsthetic harmony between a plant and its natural surroundings, so that we prefer, in the frankly artificial setting of the garden, those plants that we have never seen in their wild state. The only native plants that do not seem out of place in the border are rarities, such as Geranium lancastriense, Fritillaria Meleagris, and the Welsh Poppy, which few of us ever see outside the garden. These, like all our rare and beautiful native plants, have been cultivated by nurserymen for generations, and there is not the smallest excuse for adding to their rarity by collecting them.

Much more obviously fitted for the garden than any of our normal wildlings are the variations from type among the common plants that happen to have a decorative value. There are many such abnormalities, and we think at once of doubleness, albinism, variegation of foliage, and a fastigiate habit of growth. These are all "monstrous pieces of Nature," and we need not hesitate to collect them, for though such variations may be valuable in the garden, they are nearly always useless to the plant and may be often a positive handicap to it in the struggle for existence under normal conditions. D ness is an aberration that is characteris useless to the plant, but often enhan value to the gardener. It ruins the gr many plants, such as Irises and Campa but it heightens the effect of those f whose beauty depends upon their n grouping, and it often adds a depth an ness to their colour. Its occurrence our common wild flowers has given us two good garden plants. There is the Lady Smock, which is a perfect little plant with its solid spires of Lavender miniature Stock, while the normal delicately charming in the water mead hopelessly lost in the garden. Anothe is the double white Meadow Saxifrag "Pretty Maids all in a row" of Mary den. (Campanula pusilla, I suppose, su

Our native flora is still a great
of possibilities for the gardener, for
s are constantly appearing, and pro-
often disappearing, since the decora-
s usually have but a short life in
the rough-and-tumble competition of their natural surroundings, and those who care for flowers will do the community a good service if they keep an eye open for good-looking variations among common plants and introduce them to their gardens. For many good plants that we now reckon familiar would never have been known were it not that "being observed by some curious lovers of varieties they have been transplanted and so made more common."

F. A. H.

Wallflowers

There are a great many varieties of the common Wallflower (Cheiranthus Cheiri) in existence at the present time, and these are among the best of spring-flowering plants. In past years we have had them in bloom for many months, commencing to flower as early as December, and continuing to bloom throughout the winter, in favourable seasons, by raising plants of the early-flowering kinds. The ordinary standard biennial varieties continue the succession throughout spring and early summer. Wallflowers are true harbingers of spring, and to-day they are grown more than ever, both for market purposes and for decorative work in the flower gardens of large establishments, parks and public gardens, and in villa and cottage gardens. They are equally useful massed in beds or borders, by themselves, or in conjunction with other spring-flowering subjects, *e.g.*, Tulips and Daffodils.

Wallflower seed is very often sown too late, with the result that the growth has not had time to mature properly to enable the plants to withstand the winter; consequently, and in the event of the plants pulling through, many of them are so weakened that they make a poor show of bloom later on. I have grown large quantities of Wallflowers in this locality (Midlands), for very many years, with unfailing success, and they have always proved a standby when many other spring-bedding plants have done indifferently through one cause or another. The procedure usually followed in their cultivation is to endeavour to grow the plants on without a check throughout, from the time the seed is sown until the plants are put out into their flowering quarters in October. The seed is sown the first week in May on ground not recently manured, in drills 1 foot apart. As soon as the young seedlings are large enough, they are transplanted into rows 15 inches apart, allowing 8 inches from plant to plant in the rows, choosing a showery time for the operation. After transplanting, the seedlings are watered to settle them, and to assist them over their removal. During the summer months the soil between the rows is kept clean and aerated by frequent hoeing. This hoeing, and constant stirring of the soil, is the secret of success during the growing period, between June and October; growth and root action is encouraged, and evaporation of the moisture from the ground is retarded, the loose top-soil acting as a mulch to the plants. By the time the planting-out season arrives they have developed into splendid, bushy well-matured plants, capable of withstanding the rigours of winter, and in the spring producing flowers of good size and texture in abundance.

Many Varieties

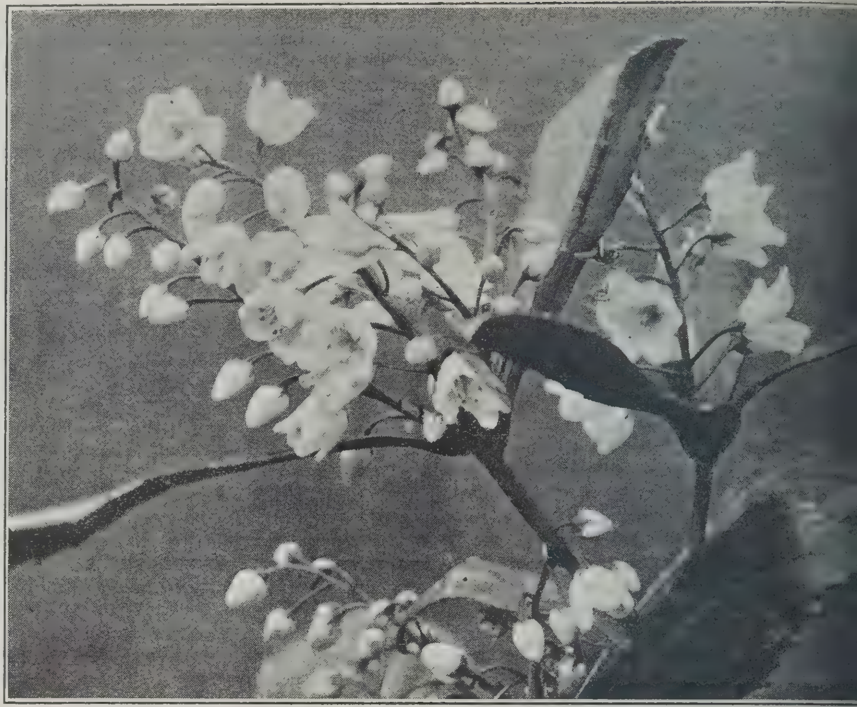
There are now a large number of varieties to choose from, all of which are worthy of cultivation, each variety having some outstanding merit to recommend it. The actual choice is really a question of individual taste or requirements. Apart from their usefulness for spring-bedding purposes, the plants afford a good green foliage throughout the winter months.

Besides the common Wallflowers, there are a number of perennial species of Cheiranthus, but all are not quite hardy. Some of these, however, will grow and survive mild winters if planted on rockwork, or on walls. One or two are worthy of mention, *e.g.*, alpinus, mutabilis, Menziesii, and Marshallii, the latter a supposed hybrid. The following are a few varieties in the biennial group of distinctive merit: Fire King, vivid orange-scarlet, height 15 inches; Orange Bedder, rich orange, shaded apricot, dwarf compact habit, height 9 inches to 12 inches; Sutton's Giant Blood Red, a variety of sturdy habit, and large spikes of bloom, freely produced, height 15 inches to 18 inches; Cloth of Gold, one of the best yellows, and very effective in large masses, 18 inches high; Sutton's Three Queens—Purple Queen, rich purple or ruby colour; Faerie Queene, primrose and pale citron flowers; Eastern Queen, apricot changing to rosy-pink, height about 18 inches; Harbinger, an early bloomer with rich brown flowers, height 18 inches; Ryder's Crimson Velvet, rich crimson flowers, freely produced on large spikes about 18 inches high; Golden Vulcan, a golden counterpart of Crimson Velvet, a rich golden colour, and with a fine habit, freely produced and lasting flowers.

A double-flowered form of a native Bramble

Siberian Wallflowers

The Siberian Wallflower (Cheiranthus Allionii) has come into considerable prominence during the last few years. Its flowers are of a brilliant orange colour, and produced with extraordinary freedom. The plant attains a height of 9 inches to 12 inches on the average. It is one of the most delightful of early-flowering plants, and may be used for spring-bedding purposes, or to provide a succession to the ordinary Wallflowers. It makes an ideal subject for beds, borders or rockeries, continuing to bloom the whole season if the seed pods are removed. Grown in large masses or groups, it is very effective, creating a brilliant display. The plants may be treated as biennials, in the same manner as the ordinary Wallflowers. Seed may be sown in June or July, transplanting the seedlings into nursery rows, and later transplanting the plants into their flowering quarters in October. Another sowing may be made in August or September, planting out the following spring to continue the succession throughout the summer months. Care should be taken when transplanting, as tap roots are formed, which are easily damaged, and failure may result if carelessly handled, especially when the plants have attained a considerable size.



Anopterus glandulosus

A beautiful flowering shrub from Tasmania shown at the last R.H.S. meeting by R. Gill and Son, Falmouth

The Ceanothus

The Ceanothus have long been in the front rank of flowering shrubs, and are deservedly popular, being elegant, rapid in growth, and beautiful in bloom. Some attain moderate dimensions, while others are dwarf bushes with rounded form. The varieties have proved fairly hardy and useful in the summer garden, flowering freely and showing considerable beauty of foliage.

The headquarters of these shrubs is the Pacific slope of N. America, and in cultivation they do best when baked by the midday sun. If well hardened they will grow with vigour and defy frosts, though some slight covering is necessary during very severe weather.

All the species are attractive. There are one or two that give better results when allotted wall space, even in the warmest counties, but this should not deter amateurs in other climes from selecting a warm corner.

The following are among the more important:—Ceanothus Gloire de Versailles, one of the best for the open border. Extends the season well into autumn. This plant requires to be fairly hard pruned as soon as frosts are unlikely, say, the middle of April; in fact, all the varieties should be seen to in
this respect as the flowers are prod
the current year's growth. C. azur
fers a wall with a southerly aspect,

LA MORTOLA

Cypresses and Echiums

La Mortola

Some impressions of a famous garden

Egarden of La Mortola was con-
vi and created by one who was not
ly a keen gardener, but an ardent
of Nature. When the late Sir
Hanbury first took over the estate
7 it was his intention to make it a
ninly for the plants of the Mediter-
rgion, but it has become a botanical
offering hospitality to representa-
he flora of the globe. Albeit, it is
its founder desired it should be,
else a garden, a garden not only
and trees but of tranquility and
al beauty.

t any rate, was the first and most
npression I gathered there. Hav-
ached it, as all doughty pilgrims
the noisy, dusty, racketing, over-
oast road, and descended into its
1-bathed peace, one becomes con-
a profound and soothing calm
als about one like a fragrance. It
occasions that one thinks of Bacon
o whisper his immortal words lest
keyed savour with which they have
ivested should even shadow their
eauty. Moreover, words of still
neration will by this time have
he visitor's attention, for here,
stone and appearing as if borne by
pitual messenger from an enchanted
he inscription :—

IERUNT VOCEM DOMINI
EAMBULANTIS IN HORTO

eard the voice of the Lord God
walking in the garden . . .

e centre of the garden stands the Palazzo, mellow and restful in its Italian architecture and soft colouring, and from the terraces adjacent to it one may realise that the grounds, sloping steeply seawards, do not only occupy the whole of a cliff-walled promontory of about 100 acres in extent, but that Nature could hardly have bequeathed to art a spot more highly favoured for the making of such a garden as this.

But, let me hasten to explain that I do not mean to imply that the climate of this part of Italy is always ideal for gardening. Ask Mr. McLeod Braggins, La Mortola's superintendent, and he will tell you that if recent experiences of wintry weather on the Riviera have been rather more than exceptional his records show not a few disastrous visitations of the sort, not to mention deluges of rain of tropical violence and hurricanes of devastating force.

No, it will not do to assume that gardening is all so easy on the sunny Riviera. When I suggest that those who have created La Mortola have had the gods on their side I mean to infer that the natural features of that rugged cape with the grandeur of its sea and the wild, rocky precipices which rise so impressively to landward, not forgetting the stream and its deep, shady ravine on the western side, together comprise a raw material of such unique charm and possibilities that if La Mortola is a gem among gardens it owes not a little to the setting.

That La Mortola might have had a different fate is true enough. But Sir Thomas Hanbury knew better than to violate that which is the most priceless feature of the place. And as one wanders about the gardens it becomes increasingly manifest that as little as possible has been done which would in any way tend to intrude upon Nature's own design.

The last time I was at La Mortola was early March, and upon each of the two long days spent there the sun shone from a cloudless sky of Italian blue. The temperature felt like that of an English June, and the sea which washes the line of that superb crescent, the " Shore of the Setting Sun," between La Mortola and Genoa, lay calm as a lake, blue as a Gentian, beyond the Pines which fringed the rocky walls of the garden.

Of the vast number of things horticultural gathered together in this garden it is clearly impossible to write here, but, in briefly touching upon some of the more outstanding features, the noble avenue of Cypresses which at one time lined the only approach to the Palazzo, viz., that from the Roman road, via Aureliana, which traverses the garden, is worthy of a foremost mention. There may be finer specimens of Cupressus sempervirens in other parts of the world, but the stately, sombre columns of this avenue, rising black against the intensely brilliant sea and sky, here occupy a position so commanding and so dominate the main part of the garden that they will leave their imprint on the memory if anything will. Moreover, at the feet of these giants are ranged the many Echiums which are grown to such perfection in this garden. Only a few of these, notably E. formosum, were in flower, but one saw enough to realise something of the wonderful masses of Borage-blue with which these huge Buglosses must challenge sea and sky during the later days of spring.

About 100 species and varieties of Acacias (Mimosa) are grown at La Mortola,

Succulents at La Mortola

which means that there are few months of the year in which some of them are not in flower. Nearly twenty of the winter and spring bloomers were on show when I was there, and some of these were so full of their billowy gold that the air about them was heavy with their Meadowsweet fragrance. Always in curious distinction to the Acacias on the Riviera are the Citrus trees, and these, as all the world knows, are a strong line at La Mortola. Not only does the broad, dark-green leafage and rather stiff habit of the Oranges and many of their kind make a striking contrast to the light and elegant Mimosas with their vivid yellows, more lively greens and steely emeralds, but the aromatic odour of Citrus fruits in hot sunshine has a pungent tang which is wholly absent in that of the other. Although my memory of the Orange tribe in California was still fresh, the wide range of kinds seen here was something of a revelation. There were Oranges of every conceivable size, from midgets like marbles to huge yellow globes as big as the crown of a bowler hat. The former represent the class often used by Italians who make crystallised fruits, while the latter are familiar to us only in the form of candied-peel. There were also blood Oranges in various degrees of " bloodiness " as well as varieties which yield both from their aromatic rind and scented blossoms the oils used in perfume distilleries. Also in abundance were those sour Oranges which nobody wanted until a Scotchman came along who, finding they could be had for nothing, invented marmalade. As for sweet ones, Mandarins and the rest, these are raised in endless diversity. There are Lemons as fat as Pumpkins, Limes small enough to sit in acorn-cups, with an interminable number of intermediate sizes, while the Grape Fruits graciously offer the innocent a solution of the origin of their popular name by growing in great pendulous clusters.

Agaves and Aloes

The present owner of La Mortola has a weakness for succulents, and his collection of these weird things is probably one of the finest in the world. Since my ignorance of succulents is abyssmal I can only assume that interest in them is a matter of temperament, and am ready to believe that they make charming pets when once you get to know them. But I seldom feel really at ease with succulents, for you never quite know where you are with them. Here, for example, is a fluffy ball of iridescent monkey-fur, so silkily soft that it invites you to stroke it; a most engaging toy. But your kind intentions are immediately frustrated by its next-door neighbour, some fiery Mexican, who leaps forth brandishing blood-red spears in his gory hands. Again, the lovely scarlet blossoms of a Cereus may hold your admiration, but only until your flesh suddenly creeps and you shrink with horror from a squalid, loathly object, which, like a slab of putrefied liver, is lurking in the shadow of that beautiful Brazilian.

No one who is confronted by the " plantes grasses," as the French gardener calls these vegetable camels, can complain that if La Mortola is a place of unspeakable loveliness it does not stage any thrills, and pretty dramatic thrills, too. For here the giant and the pigmy hob-nob with one another; fairy princesses flirt with ogres of sinister and dreadful mien. The grotesque and the sublime, the beautiful and the ugly bask in the same sunshine; the ferocious and the debonair share the same rock; the damned and the dejected writhe and coil
feet of the tall and gracious.

THE FAMOUS RIVIERA GARDENS AT LA MORTOLA

. In the Italian garden.

. Datura suaveolens (sweet scented). Note the large trumpet-apl white flowers.

. The Snowdrop Tree or Silver-bell Tree (Halesia tetraptera) near e lazzo.

4. Mr. S. McLeod Braggins (Superintendent of the gardens at La Mortola) standing by the bole of an Olive tree

5. Strelitzia angustifolia, a Bird of Paradise flower from South Africa.

6 and 7. Pines, Palms, and succulents, including Prickly Pears, Opuntias or Indian Figs.

iums already suggesting full summer, with Gerberas, Agathæas, Strelitzias, the fragrant Enocephalus africanus, Reinwardtia trigyna, like a glorious yellow Linum, and the lovely Westringia rosmariniformis. Fuchsia triphylla and F. corymbiflora were very delightful, as was the dainty rose-pink Lopezia miniata. A Clianthus was making a great show of colour with its clustered lobster claws in a rich scarlet, whilst on some of the walls Bougainvillea glabra, in one or two choice varieties, as well as B. spectabilis and B. lateritia were reminding us that there are better colours than the prevailing magenta in this gorgeous race.

So one might proceed indefinitely endeavouring to unfold the treasures even of a winter's day of this famous garden. But, conscious as I am of many omissions, the exigences of space have to be regarded. La Mortola is as inexhaustible as it is enchanting.

A. T. JOHNSON.

Research in the Garden

DURING the life of GARDENING ILLUSTRATED considerable progress has been made on the scientific side of horticulture, especially during the last 20 years. Previous to that many cultural operations which obtained were practised, because, by the long process of trial and error, it had been established that such methods produced good results. The last 20 years of our existence has seen many changes, and the labours of our scientists have enabled us to make a more rapid progress than was possible by the trial and error method, but it should be noticed that this rapid progress has, in the main, been built up on the solid foundations of past experience.

We live now in the age when we are very gradually finding out why we do certain things in the garden. If we make a critical examination we must admit that research during the last decade has established the fact that much of the old rule-of-thumb practice was based on right lines. As an example let us recall the fact that many, many years ago gardeners who aimed at producing Potatoes free from the blemish of Surface Scab grew their crop in leaf-soil. Within the last few years Millard, working at Leeds University, has shown why this was so. Millard demonstrated the fact that the organism which caused Surface Scab in Potatoes normally lived as a saprophyte, on decaying organic matter in the soil, but if organic matter was short in any given soil in which Potatoes happened to be, the organism concerned would attack Potatoes as its first choice when decaying organic matter failed. In view of this the growing of Potatoes in leaf-soil, which is practically pure organic matter, was very sound practice. Many examples could be given to show that gardeners in the early days of the life of GARDENING ILLUSTRATED did many things, the real reason of which they knew not, but research has shown that they were right. To the student it is of interest to take any of the established cultural practices and try to find out the reason of it all.

It is often stated that we have more insect pests and fungoid diseases in recent years compared with 30 or 40 years ago. We are of the opinion that this is due to at least two causes. (1) Present-day research is gradually clearing up many of the life-histories of the organisms concerned, and it is now possible to define the actual cause of crop failure, but in the old days "blights" were accepted as part and parcel of certain years, and often several organisms were concerned when only one cause was accepted. (2) Plants are now grown on a greater scale than in the old days, *e.g.*, Tomatoes used to be a crop grown by a few in private gardens scattered all over the country. If a crop failed it was destroyed and no very great harm was done. Now Tomatoes are grown by the acre, organisms which cause crop failure have a very fine chance of multiplying with extraordinary rapidity, and the destruction of a few plants thought to be affected does not control the trouble, because the organism had spread its activities beyond the few. Further, the Tomato must of necessity be grown on the same site year after year, and this fact alone tends to favour the development of the troublesome organisms.

Perhaps the most outstanding event during the last 50 years in connection with pest control has been the placing on the market of so-called tar-oil washes, which have enabled gardeners to control certain troublesome fruit pests during the dormant period of the year. Tar distillates are as yet a long way from being perfect, but even the imperfect article is superior to anything we had in the past.

Research work with fruit culture has made rapid strides in the last 50 years, and the work at East Malling and Long Ashton has helped to clear up much that was obscure. Not the least of this work is that of root stock influence. We can now buy Apple trees on a definitely known stock which can be relied upon to produce a tree which will answer the purpose for which it is intended. The work of Apple stocks has reached a very advanced stage, and progress has been, and is being made with the other fruits.

Research has helped to clear the character of many a young gardener. The case we have in mind is with regard to the culture of certain plants which have always been known to be liable to "damping off." Of the many, perhaps Cinerarias will do as an example. Twenty years ago, if one was in charge of a batch of Cinerarias it frequently happened that just as the batch was coming into flower some of the plants began to wilt and eventually die. When the head paid his next round the journeyman in charge was blamed for over-watering, and to be "sacked" for so doing was not unknown. The research worker has now established the fact that the damping off of Cinerarias is due to a fungus the spores of which are liable to lurk in many places in and around the greenhouse, decaying staging or even the greenhouse itself. It can also be introduced in the soil by contaminated water.

The position of soil and manurial problems is similar to that of the other branches of our work. We now know much that we did not. The actual use of organic manure is more thoroughly understood, while the extended use of inorganic manures to supplement depleted supplies of the organic material has done much in producing larger crops. Synthetic farmyard manure is now an accomplished fact, and in many gardens waste material is being treated and made into good manure which, 10 years ago, would have been destroyed by fire, and the ash only used. The advantages of research are not confined to the country in which the work is done, and synthetic manures is a case in point. By adaptations of the same process much waste organic material in many parts of the world is being used to produce crops of Maize, Cocoa, Tea, Sugar, fruit, etc., etc.

Enough has been said to indicate that, during the last 50 years, considerable progress has been made in clearing up some of our problems. Much remains to be done, but we can look forward with confidence to the future. Each piece of work done helps on the cause, and as long as practice and science work hand in hand good must result.

Notes on annuals

, ixing all thoroughly together. Pot-
uld only be moderately firm. Return
ame temperature, give a good soak-
tepid water, and from henceforth shade from bright sunshine. Attend carefully to the watering and little more attention will be necessary, the above-named fertilisers being, in most cases, all that the plants will require to carry them through the flowering period. While it is as a biennial that the Gloxinia will give of its best, the very best colours and forms may be retained, if desired, and treated in the usual way, but certain of the modern strains of this plant are so uniformly fine that it is hardly worth while troubling with old bulbs. C. BLAIR.

Preston House Gardens, Linlithgow.

Hybrid Streptocarpus

These beautiful hybrids have of late years greatly increased in public favour. Their cultivation is easy, and, when well grown, they amply repay the time and trouble spent on them. They produce a continuous succession of large trumpet-shaped flowers embracing colours from pure white to rose, purple-lavender, red, and rich rosy-purple. The three species that have played the most important part in the production of these hybrids are S. parviflora with small white flowers, S. Rexii with bluish flowers, and the curious S. Dunni with one enormous leaf and reddish flowers. If we consider the quality of these three species we are at once struck with the great advance made in substance, size, and colour of the splendid hybrids of the present time.

Seed is easily obtained, and should be sown in a temperature of 55 degs. to 65 degs. in February or March. As the seed is very minute it requires handling carefully. The pots and pans employed must be quite clean and well drained with crocks, over which place a layer of Moss, finally filling them to within an inch of the top with a compost of loam, leaf-mould, and sand. Make the surface quite level and moderately firm, water through a fine rose, and leave the pots or pans to drain for an hour before sowing the seed. The latter should be covered very lightly with very fine soil. Place a pane of glass over and stand the pots in a snug, shady corner away from the draught. Turn the glass over each morning, and directly the seedlings are large enough to handle transplant into well-drained pans filled with a similar compost and return to the same position as before until established, when remove to a shelf near the glass. Here they will grow rapidly and soon will require transferring into 3-inch pots, using a little more loam than before.

During summer no fire-heat is needed, and they thrive best in a snug, shady structure such as Ferns delight in. As autumn approaches, the strongest will throw up a few flowers. Throughout the winter keep the plants in a structure with a minimum temperature of 45 degs., taking care not to overwater. As spring advances additional moisture is required at the roots, when they will soon start into growth, and, if shifted into larger pots, will flower nicely through the summer and well on into the autumn. During the flowering season they derive considerable benefit from a little weak liquid-manure occasionally.

Where a warm structure exists the seed may be sown in January, and, if grown on quickly, will flower the following summer. Even while in the 3-inch pots many will flower well and are useful to place in small vases for table or room decoration. One great thing in their favour is that the flowers last well in the cut state.

Amateurs will find these hybrid Streptocarpi highly decorative plants, and under the above treatment will secure a wealth of flowers. The first year the plants usually throw from two to five flowers on a stem and from 20 to 25 spikes, and as the plants become stronger and older the flowers are much more freely produced, 50 to 70 flowers in various stages of development being frequently seen on a single plant. F. H.

The Tuberose

The Tuberose (Polianthes tuberosa) is, owing to the delightful fragrance and beauty of its flowers, one of the most popular of cultivated plants. According to Miller it was first introduced to this country "from Genoa by the persons who import Orange trees." Some doubt will always exist as to the origin of the word tuberose. It is generally accepted as designating a tube Rose, but it must be admitted that neither the plant nor the flower has the slightest resemblance to the Rose. The probability is that the French way of spelling the name is the proper one, *i.e.*, "tubéreuse," which means tuberous, and is in unison with the correct description of the plant. Even the Italian name "Il Tuberose" may be translated into tuber-flower or bulb-flower. Although it was originally imported into this country by Italian merchants it is known to have been long and extensively cultivated in the East Indies previous to this.

Large quantities are now imported into this country from America, and the double American variety, Excelsior Pearl, is the finest strain, having beautiful pure white double flowers of delicious fragrance. The tubers are procurable through the usual channels from January to April, and when received are quaint and somewhat shapeless in form, with an abrupt and singular base, and very dry. Their culture, or rather the growth and production of flowers from the bulbs prepared overseas, is of the simplest. They only need starting in moderate heat to induce them to form leaves and push up their flower-spikes. All side growths should be removed from the bulbs to divert the full strength of the plant to the central growth. For greenhouse or conservatory decoration they may be grown singly in 5-inch pots, giving aid with dilute liquid-manure when the pots have become filled with roots and the flower-spikes are developing. By growing them in successive batches the season of flowering may be extended throughout the summer. They are also extremely useful in summer-bedding schemes, and for this purpose the bulbs should be started in 4-inch pots in April and planted out at the end of May, when the flower-spikes are well formed. They are best planted amongst other subjects, which furnish their somewhat naked base. Unfortunately, the bulbs are valueless after the first year, and this may account for its relatively restricted use in outdoor gardening.

W. AUTON.

The flowering house or conservatory

Where blinds are not provided, this should now be shaded with one of the preparations offered by horticultural sundriesmen. Summer Cloud is a very useful preparation, looks well, and is easily applied. Such houses are now unusually bright with bulbous and other flowers, including many shrubs, and in order to retain these in good condition over the longest possible period, air should be freely given, the house being kept, as far as circumstances will permit, at a temperature not exceeding 45 degs. to 50 degs.

Winter flowering Begonias

Cuttings of most kinds are becoming more plentiful, and should be utilised as much as possible until the number—with a small surplus—has been obtained, when the old stocks which tend to breed mite may be disposed of. The earliest batch is ready for shifting into small pots.

REMINDERS FOR THE WEEK

Southern and Midland

Lawns, grass walks, and playgrounds

These must now be cleansed by hard and thorough sweepings in preparation for the mower, which will shortly be brought into use. The sweeping should be followed by rolling, which must be repeated a few times before the lawns are fit for mowing, the second rolling taking a crosswise direction. The grass should not be permitted to exceed 1½ inches in height before the first mowing, otherwise unsightly lines will remain for a long time, and as machines are usually overhauled and blades sharpened before the first mowing takes place, it is most essential that small sticks and stones should be scrupulously removed when sweeping, and the blades set slightly higher than usual the first time over, as with present-day motor mowers a nail or stone caught in the blades would probably wreck the machine.

Grass edges

It is usual—following the first mowing—to render smart and tidy the edges of all grass, the edging knife being used where necessary, as this renders future cutting of the grass by shears more effective and expeditious, by removing the grassy roots which tend to grow out of the sides of the edges. Above all, avoid the perpendicular edge which gives way the first time it is trodden upon, whereas, if cut at a sloping angle, it not only looks quite as well as the straight edge, but may be trodden upon with perfect safety. Most gardeners take a pride in such edgings, and those who have not yet adopted this principle are strongly advised to do so.

Annual flowers

Practically all kinds may now be sown on well-prepared ground in the open for summer display. A fine day, when the soil works clean and dry, should be chosen, and after scattering the seed broadcast it should be raked in with an iron rake, special attention being given to beds or drifts of Mignonette, otherwise chaffinches will devour it. If slugs prove troublesome a dusting of soot and lime will check them, and this is best applied whilst the morning dew is on the ground.

Choice annuals

Varieties which may be sown now include Rhodanthe Manglesii, and its white variety, R. maculata, R. atrosanguinea, Felicia abyssinica (a lovely blue), Mignonettes in variety, Phacelia campanularia, Phlox Drummondii in a variety of colours, Single Asters, Swan River Daisy (Brachycome), Lychnis rosacœli, Viscaria, Calandrina speciosa, Hunnemannia fumariæfolia, etc.

Bedding plants

Those of the Pentstemon and Snapdragon order which were raised from autumn cuttings and wintered in cold frames should, with others of a similar character, be planted out in their permanent quarters. This applies to quite a lot of plants which, though not to be relied upon as absolutely hardy, are quite safe in the open from this date, providing they have been hardened off gradually.

Chinese Primulas and Cinerarias

These should now be sown under glass to furnish plants for mid-winter, and where not already done a sowing of Cyclamen can still be made to provide plants for blooming in small pots, the earlier sowing being now ready for potting up singly into 60-sized pots. Avoid excessive heat and sunshine for these, a temperature of 45 degs. to 50 degs. being ample, the plants being shaded from hot sunshine.

Seakale

The thongs made from the roots as advised early in the season and placed in moist sand may now be used to form new plantations in the open, as the young growth is already visible. These should be planted at 18 inches to 2 feet apart on richly-prepared ground, where they will develop handsome crowns for next winter's forcing.

Onions and Leeks

Those raised and grown under glass must now be hardened off in readiness for planting out in the open; rich, well-drained, and prepared ground is necessary for the former, which should not be planted too deep, and should the weather be very dry at the time of planting the little plants should be watered in. Trenches will be required for the Leeks, which need a deep, rich bottom soil.

The seed bed

The time has now arrived when all kinds of winter vegetable seeds may be sown, including Brussels, Broccoli, Cauliflower, Winter Greens, Cabbage, Savoys, Leeks, and Coleworts. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Sow spring Broccoli

Not infrequently the spring varieties of this useful vegetable are sown too early. The plants get too rampant before late autumn and then are killed, or at least badly damaged, by frost and the winter gales. From now on till the middle of April is a very suitable time for having this done in our northern gardens. Three very good and hardy varieties are Methven's June, Leamington, and Evesham Giant.

Maincrop Carrots

Providing the ground is in good working order the chief sowing of this root may be made at any time up till the middle of the month. Freshly manured ground must be avoided or failure is pretty certain. The site of last season's Celery trenches, or where good Leeks were grown, will be found admirable, as a rule. The soil must be well and deeply worked, and it is advisable to well tread it down before drawing the drills.

Plant early Potatoes

From now on till the end of the month is the best time for the planting of all kinds of Potatoes, the earliest being tackled now. Well-tilled soil on a sheltered south border is the best place for the earliest batch. A fair dressing of well-rotted manure should have been dug into the soil some time previous to planting. Duke of York is still one of the most reliable for first crops, while Edzell Blue is an admirable variety for furnishing a succession to the other.

Turnips

These may now be sown freely, but "little and often" will furnish a finer supply than a large sowing at one time. The old Milan Purple Top is still, probably, the best for early sowing.

Sow more Parsley

A sowing made now will furnish abundance of good leaves in late summer and autumn, while a portion may be transplanted into frames about the end of August to provide supplies throughout the winter and spring months. A good strain of the old Myatts Garnishing I find very sa
for winter use.

Transplant evergreens

Saxifrages, Anemones, and Primulas. April flowers in the rock garden at Kew (See page 212)

axifraga Kyrillii, a distinct yellow-flowered hybrid from Bulgaria. ubby plant showing in the background is Lavendula vera.

rimula marginata, flowers mauve, from the Alps of Dauphiny and nt.

axifraga apiculata, a lovely green carpet freely studded with pale lowers.

4. Anemone blanda from Asia Minor, white, mauve on the outside.

5. Anemone angulosa, the large blue Hepatica of early spring.

6. Saxifraga marginata, a beautiful species with white flowers from the mountains of Central Italy.

7. Saxifraga Haagei, of garden origin, a dark green cushion with deep golden-yellow flowers.

Kew in Spring

(See page 241.)

THE warm sun of the past week has brought things on apace and the Crocuses on the various mounds looked very beautiful on Good Friday. Scillas, Anemone Hepatica, and a few early Daffodils gave a real foretaste of joys to come. But in this late season, perhaps, the most delightful places still are the Alpine-house and the conservatory or No. 4 House. In the Alpine-house the following were duly noted:—Iris Sindpers, like a large pale mauve Cattleya; Fritillaria pudica and F. aurea, the latter greenish-yellow, spotted (a very delightful plant for pots); Crocus versicolor var. Picturatus, nearly white and outside marked and feathered maroon; Bulbocodium vernum and Hyacinthus azureus, also looking very pretty in the rock garden; Scilla sibirica and the white variety, alba; Tulipa Kauffmaniana var. Brilliant, a wonderfully beautiful, warm, cerise colour, and the more ordinary creamy one; Saxifraga Grisebachii Wisley Variety, particularly fine in large pans; the pretty little mauve Crocus Corsica; Shortia uniflora var. grandiflora (pink) and S. galacifolia (white, shaded rose). Narcissus were represented by those little gems Nanus and Cyclamineus, nearly over, and at the end of the house Daphne odora just coming out to delight us with its fragrance.

In the conservatory fine groups of colour were to be seen. Rhododendron violaceum, a striking and distinct colour at this time of the year; Clivias; Prunus Sieboldii; Eupatorium Raffillii with its scented Ageratum-like flowers. Genistas formed another sweetly scented group. Rhododendron molle made a fine show at one end of clear lemon-yellow. Callistemon citrinus, nicely out, with its curious red brush-like flowers, and the Strelitzia or "Bird of Paradise Flower" was just showing colour, and the Cyclamen persicum, Primulas, Hyacinths, and Narcissus in variety were a great centre of attraction, judging by the large crowds of admirers.

A. L. W.

Herts.

Postponement of Daffodil Show

Owing to the lateness of the season the R.H.S. Daffodil Show, which was to have been held in the Society's new hall in Greycoat Street, Westminster, on April 9th and 10th, has been postponed for a week. It will now be held in the old hall in Vincent Square, Westminster, on Tuesday and Wednesday, April 16th and 17th. All entries must reach the Society not later than by the first post on Saturday, April 13th, but it will be helpful if they arrive earlier.

EXTRA FORTNIGHTLY SHOW.—In view of the postponement of the Daffodil Show the Society will hold an ordinary fortnightly show in the new hall in Greycoat Street, Westminster, on Tuesday and Wednesday, April 9th and 10th.

STANDING COMMITTEES.—The Fruit and Vegetable, Floral, Orchid, Narcissus, Scientific, and Library Committees will meet at the usual times on Tuesday, April 9th. As the Daffodil Show is confined to Daffodils only, the Narcissus Committee will meet on Tuesday, April 9th.

The Gardeners' Royal Benevolent Institution

The 83rd Anniversary Festival Dinner in aid of the Gardeners' Royal Benevolent Institution, will take place at the Mayfair Hotel, Berkeley Square, W., on Wednesday, June 26th, when Mr. Lionel de Rothschild, O.B.E., will preside.

Answers to Queries

Questions—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent each should be on a separate piece of paper, the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of d
cannot always be replied to in the is
ately following their receipt. We do
queries by post.*

Naming plants—*All who wish the
be named should send fair examples
stem, leaf, flower, or fruit. (Snippe
and points of shoots are useless.) Not
four plants should be sent in any one
same correspondent. Where more th
is sent they should be numbered. Of
cones should always be sent.*

TREES AND SHRUBS

Myrtles and frost

Please tell me what should be done with a large Myrtle bush which is very much cut with the frost and all the outer leaves are brown. Also the Veronica bushes have their leaves quite shrivelled. Should they be left to recover, if possible, or is it better to cut them back, and, if so, when should this be done?

"TALBOT."

[Leave them for another week. They may show signs of recovering, when the plants should be trimmed back and all the dead wood cut clean away.]

Shrubs for a London garden

(F. V.).—The following may confidently be expected to thrive in the neighbourhood referred to:—Rhododendrons, the Portugal Laurel, Hollies, Euonymus in variety among evergreens, while flowering shrubs might include Viburnums, Philadelphus, Ribes, Exochorda grandiflora, Forsythias, and Laurustinus. Weigela rosea and Ghent Azaleas, too, would, almost certainly, succeed.

CHRYSANTHEMUMS

Chrysanthemum book

(James Warr).—There is a very good little book on the subject, "Chrysanthemums for Amateurs," by H. H. Thomas, which costs 1s. 9d. post free in this country, but something additional would be required when mailing it to U.S.A. It may be had from Messrs. Barr and Sons, 11, 12, and 13, King Street, Covent Garden, London, W.C. 2. This firm also offer "Chrysanthemum Culture for Amateurs," by H. J. Jones, post free in this country for 2s. 3d. This latter is probably the book you inquire about.

ALPINES

Alpines to cover stones

("Alpine").—(1) As you gave the heights of the stones you wished covered we naturally supposed that you required robust-growing rock plants. Had you merely mentioned that you wished to cover stones flush with the soil there would have been no difficulty in giving you a list of creeping kinds that, in time, would grow over such. You can select Arenaria balearica, A. montana, Acæna, Arabis, Aubrietia, Cerastium, Dryas octopetala, Alpine Phloxes, some of the more robust Mossy Saxifrages, like Wallacei, Rhei superba, cæspitosa, camposii, Clibrani, decipiens, and trifurcata, and Thymus. (3) Even if the Roses are unsuitable the other plants named in a former reply should suit.

FLOWER GARDEN

Farfugium Grande and F. argentea

(A. L.).—We find no mention of this in any hardy flower list. Possibly there are no stocks of it in the country. This is, undoubtedly, owing to the fact that an element of tenderness renders it unfit for open-air culture. In highly favoured districts which experience no severe prolonged frosts and where the vicissitudes of our English climate are felt in a modified form only it would probably thrive. In a London nurs
grown in tubs for exhibition purpo

Plants for sandy soil

(Erika).—The combination of
"practically pure sand" and ra
formidable one. Few plants of
habit will succeed under such cond
the absolutely rabbit-proof plant
be discovered. The Armerias or S
the Horned Poppy, the Arenaria
worts, the Sea Buckthorn, the com
Thorn (or Sloe) are practically the
which suggest themselves and w
have any chance of surviving.

Planting a small pond

(E. A. O. Travers).—Before any
attempted it will be necessary t
mounds of the following mixtu
plants to grow in:—Best turfy l
curable—and, if not, the best loa
procure—should form two-thirds
ture, the remainder being made
seasoned cow manure and leaf-m
should be about 9 inches in d
leaving 9 inches of water over
which will be found satisfactory.
accommodate six Water Lilies.
the following:—Nymphæa Esca
Meteor, N. James Brydon, N.
albida, N. m. carnea, and N. Moor
Of other water plants we suggest
ing:—Aponogeton distachyon,
umbellatus, Caltha polypetala,
trifoliata, Ranunculus lingua,
variabilis, Scirpus lacustris (the
rush) and its variety S. l. ze
Pontederia cordata. Some of the
in good soil rather rapidly, and we
to limit yourself to one plant on
kind, otherwise you will shut out
entirely and thus destroy what s
pretty and interesting feature. T
the tree is rather unfavourable
the plants, and Water Lilies do
sun. You should be able to p
whole from either of the
nurserymen:—Messrs. Amos Per
Nurseries, Middlesex, or Messrs.

BY APPOINTMENT.

AWNS Require Attention—NOW

NOW is the time to feed your lawns in preparation for the summer months. A reliable complete fertilizer will quickly create dense turf. Moss, clover, and weeds should be eradicated now by applying Fisons' Lawn Sand.

Fisons' Technical Bureau is maintained for the benefit of enquirers, without obligation.

FISONS'
LAWN GUANO
(A Compound Fertilizer)

est dressing for turf. It feeds the turf over a long period and will not burn lour the grass. Lawn Guano quickly strengthens the roots and encourages growth of fine grass. As used by important clubs and municipalities. Apply the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**5/-**	**9/-**	**15/-**	**25/-**

FISONS'
BASE FERTILIZER

be incorporated with the soil before sowing grass seed. Specially prepared note strong root growth and give new grass a good start. Use 4 ozs. to the a few days before sowing the seed.

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**4/6**	**7/6**	**12/6**	**20/-**

FISONS'
LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and in so doing stimulating the grass. A thimbleful destroys a large weed, such as a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Measure and full instructions sent.

Prices, in Kegs :	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**5/-**	**9/-**	**16/-**	**27/6**

FISONS'
GRASS SEEDS

are the finest procurable, being specially tested before selection. Special Mixture (for Bowling and Golf Greens, finest grasses only).

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**15/6**	**30/-**	**58/-**	**110/-**	**210/-**

Zeeland Day Line
L.N.E.R. Night Route

petals. This pest in the adult stage is about one-third of a line long, of a pale brown colour. It is furnished with four narrow, fringed wings; the hind part of the body is black and shining. The larval stage is wingless, but very active, the colour dull yellow. The pupa stage is very sluggish. All three stages were present in the specimens sent. Thrips are very destructive under glass and breed under this condition all the year round, especially when the atmosphere is on the dry side. The recent cold spell would assist the spread of this creature, because much firing had to be done, and perhaps you have not used sufficient water to counteract the extra heat. Usually by good cultivation and the judicious use of the syringe for damping down Thrips can be kept under control. Your best method of control now will be to give the plants a light fumigation with nicotine on three successive evenings, afterwards keeping plenty of moisture around the plants. We can understand the frilled varieties only showing signs of attack, because the frilled petals offer more chance of the Thrips finding a good hiding place.

Cordyline indivisa flowering

(P. Griffiths).—It is nothing unusual for this plant to flower and occasionally mature seed in this country. You will assist if you pollinate the flowers at midday when fully out and by keeping moisture from them until the seeds are set.

A floating sundial

When placed upon the water in sunshine it is claimed that the dial will automatically "set" itself, giving true solar time and true compass points. Supplied by the John Holmes Timekeepers, Brighton

VEGETABLES

Tomato fruits

(Harrietsham).—We think that if you wrote direct to Messrs. Carter at Raynes Park they would be in a better position to reply to your query *re* Tomato fruit.

ROSES

Diseased Rose wood

(Harrietsham).—The Rose specimen sent for examination is affected with Crown Gall, which is caused by a bacteria, namely, Bacterium tumefaciens. This disease is recorded from all over the world, and it attacks many cultivated and wall plants. With Roses the galls are always hard, such as you send, and although the galls occur most frequently at the collar they may occur in any position on root or shoot. Manetti Rose stock produce the biggest galls. Plants that are growing vigorously produce bigger galls than those which grow more slowly. Some Rose growers do not consider that the presence of Crown Gall is detrimental to the plants, but it appears likely that food material elaborated by the plant is used in the production of the galls and that such food could be used by the plants in other ways. The disease can, of course, spread from one plant to another, but, as far as is known, infection must always take place through a wound. The only treatment is to cut away the gall, and all wounds so made should be painted with Stockholm tar to prevent re-infection.

Secateurs for Rose pruning

(B. A.).—We recommend the Guienne Secateurs No. 3, made by Guienne Secateurs, Ltd., 25, Spencer Road, Chiswick, W. 4.

MISCELLANEOUS

Electroculture apparatus

I have recently forwarded a trial order for four Electroculture apparatus, invented by Mr. J. Christrofleau, a well-known French scientist. With this new apparatus could it be possible to increase crops in considerable proportions, to minimise manual labour appertaining to culture, to economise immense sums of money spent annually for fertilisers?

Semarang, Java. THIO KWAN ENG.

[We have no experience of the Electroculture Apparatus mentioned in your letter. As we understand it, the use of electro culture is only in an experimental stage and has not yet reached general practice. According to "Research and the Land," by V. E. Wilkins, B.Sc., published by His Majesty's Stationery Office in 1926, "The field experiments have demonstrated that an average increase in yield of 22 per cent. may be obtained by applying an electrical discharge to spring-sown Oats and Barley. The effect on Clover-hay seems also beneficial; on winter-sown Wheat the results are uncertain. At the same time, the laboratory work on pot plants and growing seedlings is continually revealing new possibilities, and it has shown how much there is still to be discovered on such points as the ideal strength of current and the best period at which to apply it." Since this was written we have no doubt that considerable progress has been made. We should be interested to learn from you in due course the result of your experience with your purchased sets of apparatus.]

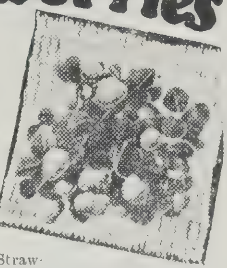
Strawberries

Yours can be
BIGGER-
BETTER-
more
LUSCIOUS
this year



Over half a-million "Magna Strawmats" have helped Strawberry growers, large and small, to get larger, cleaner, and better fruit, thus saving their moderate cost. Simply slip the plant through the hole in the mat; it is protected all the season against slugs and pests; fruit grows quicker and keeps cleaner; and picking is very much easier. Very neat in appearance; can be used another season.

Fully illustrated booklet containing many valuable Strawberry-growing Hints FREE with order for 1 gross.

PRICES

	Gross.
2-3 year old Plants (7-in. hole)	**17/6**
1 year old Plants (5-in. hole)	**17/-**

Scotland 1/- gross extra.

'MAGNA' STRAWMATS
FOR BIGGER & BETTER STRAWBERRIES

GARDEN LABELS

CHANDLER'S PATENT PLANT AND TREE LABELS are the most superior of their kind, as supplied to the Gardens of leading Titled Gentry. Made in absolutely indestructible Copper Metal; perfectly finished; bound, unbreakable edges. No difficulties as with wood and white-metal Labels. They have a Patent Lead-Capped Untearable Eyelet and Corrugated Copper Wire Fastenings. They cannot break with wind action. No string is necessary.

The name is easily written or indented with a lead pencil. Write with Label on a flat surface and press rather heavily with the pencil. The inscription thus made is *ineffaceable and imperishable.* Even after very lengthy exposure the Label can be cleaned and brightened with a simple rubbing, the name being as *legible as when written.*

Size, 3¼ in. by ⅞ in. In boxes of 50.

Prices Post Free:
3/4 per Box; 1/11 per ½ Box; 1/1 for 1 Doz.

Obtainable from:

New interest in gardening!

Simple glass "tents" bring new pleasure— and profit too.

NOW is your chance to get earlier, bigger, better crops this year in spite of the late season! All over the country gardeners are obtaining wonderful results with the CHASE CONTINUOUS CLOCHE. So simple—and so cheap! We supply the wires and flat glass. You erect the Cloches in a few moments, and cover your spring sowings. Many seeds come up in a week, and all are safe from cold and birds.

SOW now vegetables, salads, and hardy and half-hardy annuals. You will be delighted with the rapid, sturdy growth and wonderful productiveness. Our customers are enthusiastic, and it needs only a trial to convince you, too.

LOW Carriage Paid PRICES

From 4¼d. a foot run of row!

The following prices carriage free to nearest station in Great Britain. Irish and overseas orders sent carriage forward at reduced prices. See free list.

NOW is the time to make yourself independent of the weather. Send for free Handbook and List.

OFFER "S"
A set of 108 'Seedraiser' size Cloches enough for a row 126 ft. long for **45/-** carriage free. Half quantity for **30/-**

OFFER "A"
A set of 52 "A" size Cloches as photograph above, to cover 60 ft. of row, for **45/-**, carriage free. Half quantity for **30/-**, and trial dozen for **17/-**.

CHASE CONTINUOUS CLOCHE
Pound Road Works, Chertsey, Surrey

Sow Seed Soon!

Many gardening people believe that all seeds sh be sown by the end of Easter. This is qui fallacy, because Easter is a movable feast, and s years it is a month later than others.

Expert gardeners disregard this foolish theory they know sowings should go on to the end of A Never was this truer than at the present time everything this year is quite a month late owin the severe frost we had at the beginning of the sea

We strongly advise everyone with a garden to chase any seeds they may require now, and sow when the weather is favourable, and we can as them that seeds sown in April will produce quit good, if not better, results than those sown earli

We still have a few of our seed catalogues on hand and will be pleased to forward you one by return, if you will be good enough to send us your name and address on a postcard.

Kindly mention this paper.

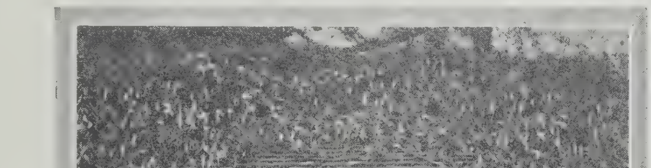
glories of double-flowered Peaches, various Crab Apples, Clematis Armandii, and Anemones under Cherry trees

H last letter told of the damage done ythat February frost. To-day I will vte of the glories that have followed tree weeks of unclouded sunshine and tnperatures. Never have I seen such os masses of bloom on the elowered Peaches (scarlet r han red), rose-pink Clara rnd the huge double white, r's double pink Cherry, the u Crab Apples in shades of al blush, that seem as if the nter had added to their n Clematis Armandii (the fom from La Mortola) scents as it hangs in wild luxuri- pm the boughs of an old ad contrasts with the Stocks, ries, and Violas beneath. In w valley the Anemones of hade of colour carpet the d under the Cherry trees, e Periwinkles, Cyclamen in ty and both Orchis and y vie with each other in nd quantity.

unum Carlesi, Forsythia mlia, Xanthocerus Sorbifolia, chorda Alberti magnifica be- r you by their beauty and are; even some of the Acacia ilta that I thought injured o in fairly good flower above ses of Coronilla Valentina I beved doomed a month ago, erful is the vivifying power nine, which makes me hope i six weeks' time England lve recovered from those , lark days of winter. The d f this most abnormal season reuire much detail in record- t. A friend from Roquebrunn that he never registered an 2 degs. of frost in his so nothing is injured. I en Bignonia venusta and villea in flower at Cap hile reports from Hyères, es and even sheltered Men- t of Palms killed by the re by frost, so there must be er difference in climate and than was realised on this . Plants, at any rate, show it plainly. Man in warmed houses knows nothing of the vagaries of weather during winter nights; not so the exposed shrub or tree.

E. H. Woodall.

La Selva, Nice.



Clematis Armandii over a summer house at Myddelton House, Waltham Cross

Inset: Flowers of Clematis Armandii, each about 2 inches across, colour creamy white, borne in clusters during April

This handsome evergreen climber is a native of China. It has persistent trifoliate leaves, the leaflets being dark green and of a leathery texture. In the gardens at La Mortola the flowers scent the air as they now hang in wild luxuriance from the boughs of an old Olive tree

Phosphate fertilisers

We have received from the Ministry of Agriculture and Fisheries a copy of the revised leaflet No. 394 dealing with above subject. The leaflet points out that:—

Phosphates serve at least five purposes in the soil:—

(1) They cause an earlier development of the young plant than would otherwise occur.

(2) They bring about a considerable development of fibrous root.

(3) They counteract the rankness of growth which is liable to occur on land richly supplied with nitrogen compounds.

(4) They hasten ripening and improve the quality of grain.

(5) They increase the feeding value of ordinary fodder crops.

The leaflet is, of course, written for farmers, but gardeners should be interested in it because all five purposes mentioned have a direct bearing upon garden crops, *e.g.*, the use of phosphates encourages earlier development in all crops, and if our crops get away well at the start good crops are to be expected. A considerable development of fibrous roots enables our plants to make full use of any manure that is in the soil, and also to make the greatest use of quick-acting manures which are from time to time added. To be able to counteract the rankness of growth occasioned by heavy dressings of nitrogenous manures is of great importance to gardeners because we are apt, if we can get it, to be fairly liberal with our farmyard manure, which is rich in nitrogen and poor in phosphates, with the result that our crops grow rank, soft, and are prone to disease. Early ripening is another important factor, especially in certain late districts, but gardeners should, however, bear in mind that heavy dressings of phosphates in early districts are apt to curtail the growing season. If phosphates increase the feeding value of fodder crops we see no reason why the ordinary crops of our gardener should not be better feeding value following phosphatic application.

Bones, superphosphates, and basic slag are compared.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Bigger British crops

It always appeals to the writer that a business man has not even the time to exploit to his satisfaction one only of the many branches of gardening, and it is with some fear that I approach a very technical subject, prompted by having just listened to a decidedly duller B.B.C. programme than usual. There are districts in England where listeners may adapt their wireless sets and experiment with their aerials on plant culture.

I know nothing whatsoever about Tomato culture—excellent things, full of vitamins—but remember that during school holidays spent learning to analyse soils at a Ministry of Agriculture Station the chemist there grew the most delicious Tomatoes, though his secret was unknown to me, and now at least one of my neighbours, also a Tomato fiend, in order to improve his crop, grows some of his Tomatoes in pots and leads his wireless aerial into the soil on one edge of the pot, a piece of copper wire being buried in the soil on the opposite side and taken thence over the pot-side to earth as with ordinary earth wires, the pot being insulated on a plate or other convenient non-conductor.

I am told that the results from this electrical treatment as regards fruiting are remarkable, and I pass on the idea simply so that the disgruntled may get some return on the outlay of their aerial.

But here in Rugby no doubt conditions are exceptional; there is quite a lot of electrical current running about wild. Transatlantic wireless telephone garble come into crystal users' programmes, and visitors to the Imperial Wireless Station on a rainy day have experienced an electrical shock, as, standing on the wet road, they clutch the handle of their car-door.

However, here is scope for experiment in some districts, and while presenting the idea free I take no responsibility for negative results to Tomato or other crop treated!

F. H. Fisher.

[We have received inquiries from others on the subject of wireless and its influence on plant growth. There is doubtless some influence upon the salts in the soil exerted through the passage of electric current there, but it is by no means clear what actually happens, and all attempts at applying electric currents so far have failed practically.]

Menispermum canadense (the Moonseed)

Recommended as an uncommon climber (see page 226 of March 30th), Menispermum canadense is an interesting rather than a showy climber. It has white flowers in June, followed by black berries which have a most lovely purple bloom, making the berries look very much like small Grapes with frost on. The foliage is Ivy-like and a nice green, which would contrast beautifully with any other climbers it associated with. Menispermum canadense is easily grown, thriving in most sites in any soil, but likes, for preference, a moist spot with a good top-dressing of farmyard manure in its growing period. It is easily propagated from seed. From the latter it was named Moonseed as they are crescent shaped.

Apple Ashmead's Kernel

I am very interested in the notes appearing from time to time on hardy fruits, especially Apples, and I have wondered why none of your correspondents mention Ashmead's Kernel, which I consider one of the finest Apples we have. We have 10 standard trees here which have only failed to crop once during the last 14 years, while in a good season we have picked as many as 100 potts (56 lbs. each).

The flavour and keeping qualities ar
cellent. We usually have fruit right
the time when we can commence to us

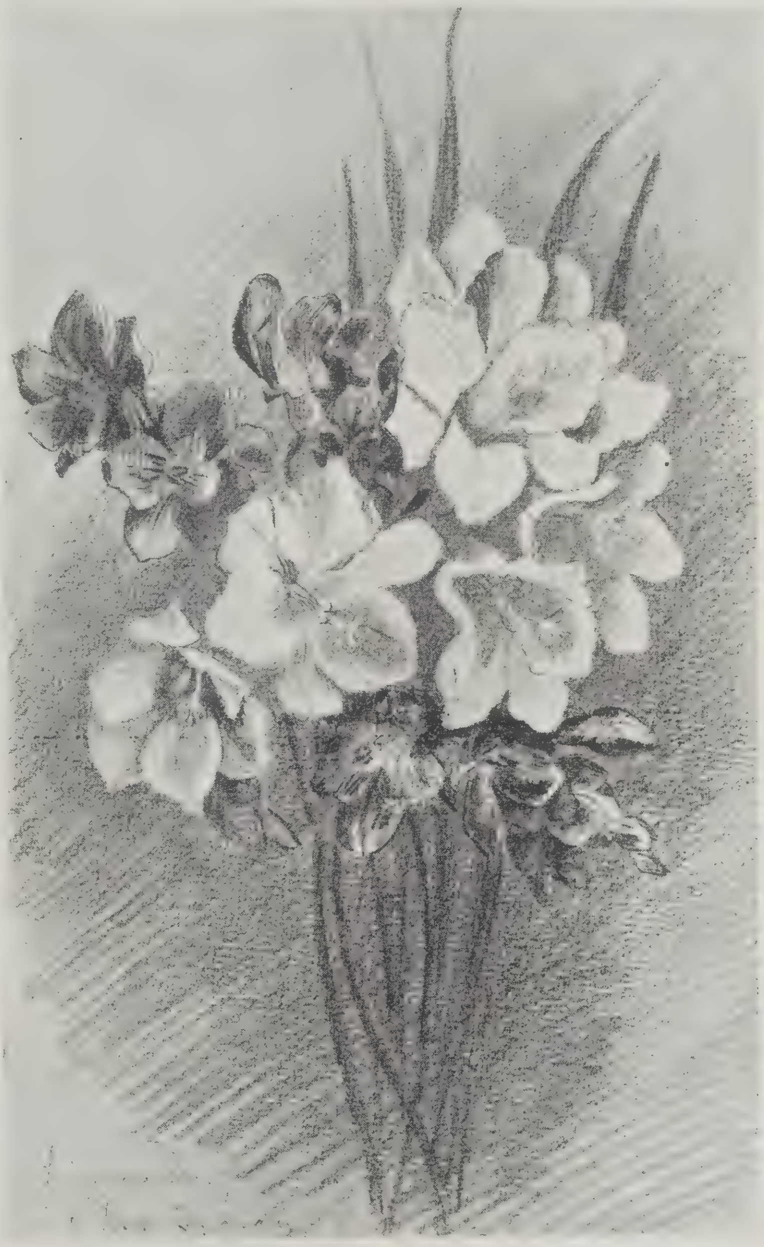
late Pear: Josephine de Malines

ariety stands quite by itself in habit th, foliage, and flavour, which is erfumed. It is sometimes described a, and often is so even on the exhibi- le, but I have had it averaging a good om cordons. It is longer coming ing than some, but it is worth wait- Pruning needs special care, for ts fruit buds usually take three years the flowering stage it sometimes de- ature fruit buds at the tips of the ear's growths, especially short ones, are not always recognisable until February, as the wood buds are also round. It is well, therefore, at the main winter pruning to leave the doubtful growths till later. This variety can be grown as an irregular bush, a medium standard, and a good cordon; though it needs experienced pruning to keep the latter well feathered. The fruit should hang as long as the leaves, which means birds have to be guarded against if much is not to be spoiled. It may be kept in good condition until April in some places and seasons, but is at its best with me in late January and early February.

A. PETTS.



From a drawing by E. A. Bowles

Coloured Freesias Primrose Day and Red Indian

Variety in room plants

The choice of pot plants for room decoration is far too often limited to Aspidistras, Kentias, and Pteris Ferns. Where is the Ficus elastica of pre-war days? This India-rubber plant is rarely seen, yet it is no more difficult to maintain than is a Kentia. Careful watering and cleanliness are the two chief requisites in indoor cultivation of this and most other decorative plants.

Chlorophytum elatum variegatum might be more popular were it not for its name. The green and cream strap-shaped leaves are quite graceful and harmonise with most surroundings. The Chlorophytum is long-suffering and can put up with a certain amount of ill-treatment. A native of South Africa, it does not require very much water, and is quite easy to propagate by division of the roots.

The Cordyline, or " Club Palm," is good for rooms where there is plenty of space. This Dracena is a native of New Zealand. It is graceful and semi-hardy. One variety provides the natives of the Sandwich Islands with food, clothing, and housing material.

Fatsia japonica, often still termed Aralia Sieboldii, is coming back into favour. The dark green, leathery leaves are very ornamental, and it is an easy plant to grow.

Grevillea robusta requires a light situation and not too much water. One of the most graceful of all foliage plants, the Grevillea hates a close, stuffy atmosphere. It is not at all difficult to rear, and lasts as long as any other plant in rooms.

Araucaria excelsa, the Norfolk Island Pine, is the most graceful of Conifers. Firm potting and moderation in watering are the chief essentials. It will last for years with proper care.

A colour group of yellow Dahlias

Dahlias grouped for colour

THE great variety of fine Dahlias now to be had makes it easy to form good masses for colour value. The pictures show a part of the garden that is given entirely to summer flowers, what were formerly known as bedding plants. Here are Geraniums, Iresines, Cannas and Dahlias, variegated Maize and Ricinus, with half-hardy annuals, such as Zinnia, Salpiglossis, Alonsoa, Perilla, Amaranthus, and French and African Marigolds. The Dahlias in the lower illustration are:—On the left a low-growing single-flowered one from Holland, nearly white, but suffused with a yellowish tinge, and beyond it one of the good yellows of moderate height of the bedding class. On the right are some of the tall kinds, of pale shaded pink, and a white of good habit nearer the path. Beyond these is a telling mass of the red-leaved Ricinus Gibsoni intergrouped with red Dahlias and backed by a tall old kind of an almost blackish-red, which tones finely with a foliage bush of Prunus Pissardi, the same dark-leaved Prunus forming a mass of rich darkness on the wall at the back. Beyond the left-hand group come Cannas and Dahlias of a softer red. G. J.

Iris cristata

The delightful little Iris cristata does not appear to meet with the demand its merits deserve, though it has been in gardens for very many years, having been introduced from America as far back as 1756. Its native habitat is in the gravel by streams in the Central States. It is quite hardy in this country and, where it is happy, increases freely. It is only about 3 inches or 4 inches high, and has wonderfully beautiful little flowers of, what Farrer calls, "the rarest crimpled powder-blue-and-golden beauty of blossom!" I am more disposed to agree with the late Mr. W. R. Dykes in his description of the colour, which he calls "delicate lavender or lilac." The "gold" of Farrer's account is rendered by Dykes as the "irregular yellow dappled crest, which is such a charming feature of I. cristata, as in other Irises of the same section." The best position for this lovely little Iris is in a rather low, damp, half-shady place in well-decayed vegetable soil with the addition of small gravel mixed with it. In northern gardens less shade is required than in those of the south. Propagation is effected by taking off the small side growth just after the flowers have withered. I have found slugs fond of this Iris. S. ARNOTT.

Gentiana Andrewsii

Those seeking an interesting Gentian would do well to plant Gentiana Andrewsii. Answering to several pet names, such as the "blind Gentian," the "bottle Gentian," and sometimes the "closed Gentian," this species, when in flower, always attracts great attention. Its flowers are peculiar because the five parts of the corolla never spread. The flower always looks as if it is only in "bud."

This Gentiana is certainly of easy cultivation, and seems quite happy in any soil, providing it is in a moist spot. It is a deep blue in colour and reaches a height of sometimes 2 feet, and is in bloom in late summer.

It is a native plant of North America; can be easily propagated by careful root division or from seed. R. MOORE.

nodically and for years I have grown
s here. Does not Reginald Farrer,
“ Yorkshire Garden,” record that in
909) “ I myself saw, with my own eyes, how ardently the little old clumps (of P. Cockburniana) were shooting back to life ”? Primula farinosa was thriving near it at the same time, I remember; and that astonished him considerably.

These, alas! are all things of the past, for the genus needs more attention than can be given it here.

But the report of the Primula conference in the R.H.S. Journal, Mr. A. W. Darnell's invaluable articles, and the fact that P. Agleniana and P. Reidii flowered well here last year has led to fresh experiments.

P. Forrestii has done well in two solid masonry walls, but both face south-west, and during prolonged droughts several of them have died. Last year I tried to replace these with seedlings, but put them out too large and too late and they all succumbed. So in the autumn I sowed seed in heat, pricked them out early, and have now transferred them to a cold frame; and am hoping that, planted out small and early in April, they may get established before the drought we so often get in May arrives.

There is a steep and lofty bank on one side of the drive, facing north, which may suit some of the more difficult species. The soil is bad, but a certain amount of better stuff can be added. P. Reidii bloomed there for two years, and P. Agleniana had one flower scape, but did not, I think, get enough nourishment. Omphalogramma has lived there, but so far has produced no flower. This year I am trying on it three large plants of P. Forrestii, one P. Winteri, one P. nutans, and a good batch of seedling P. cyanantha and Reidii. For the last three or four years I have sown broadcast on it surplus seed of Chinese Rhododendrons, and a certain number of these have germinated and seem to be doing well. Further down the drive there is a group of the Blue Augustinii, and several self-sown seedlings of this and of R. nipponicum have come up on the steep slope below among the Moss and Ferns.

Some of us have a fondness for self-sown seedlings, and occasionally they turn out to be really good things. A good many years ago I discovered four growing under a biggish Rhododendron, and, noticing that the foliage was out of the common, took them up and looked after them. They turned out to be hybrids between campylocarpum and perhaps Kewense, one white and the other three yellow with red spots, and fine large flowers at that. So much for the efforts of our friend the bumble-bee!

And now, at last, after weeks of frost and hot sun, some rain has come, and the gardener's heart rejoices, for he can listen to the wood pigeons and blackbirds before he gets up, and afterwards can see his flowers coming out in every direction.

“PETER THE HERMIT.”

Pricking off seedlings

There is a deal of this work to be carried through about this time. Best results follow when the pricking off is carried out while the seedlings are still quite small. Keep rather close and shade carefully from all sunshine for at least a week, and thus permit of the little plants getting a good start into the new soil.

Primula Forrestii

The Individual Treatment of Roses

II.

(Continued from page 232)

Recently it was suggested in these columns that of all the articles, catalogue descriptions and hints, and other contributions to the culture of the Rose, upon which the enthusiast largely relies for his guidance, hardly any ever mentioned the necessity for individual knowledge and treatment, and that in the few cases where this most essential point in really successful culture was noted, very little, if any, information was given as to what this or that particular Rose required in order to give of its best

LIME seems to be about the last thing many think necessary to the good cultivation of the Rose, and there are countless Rose gardens which have never known even a "dusting." Why, is hard to understand, for one would have thought that the mere fact of its corrective influence, specially in ground so frequently receiving regular and heavy doses of manure, would have made an occasional dressing, at least, an obvious item in their culture. I have never yet known any Rose which objected to it in moderation. Contrariwise, I have known the half of a Rose garden which received a light dressing every other year to give results in every way superior to the other half.

And there is at least one Rose to which an annual dressing is acceptable and beneficial; indeed, I would say an essential item, in its culture to a high standard. This is Rev. F. Page Roberts, one of the most popular Roses, but not often seen giving the best of which it is capable. In soil deficient in free lime it is quite ordinary, but with a good yearly dressing, accompanied by the fairly hard pruning, comparatively speaking, which it prefers, one would hardly recognise it as the same Rose. My experiments in this line have scarcely covered sufficient ground and time to be quite certain on the point, but, so far, I am inclined to think that the popular "flame" and "sunset" coloured Roses, as a whole, benefit, as regards definition of colour, at least, by the application of a light yearly dusting of lime.

Two comparatively old and indispensable favourites, Mme. Segond Weber and Mme. Melanie Soupert, may be coupled together in a preference for as little of the knife as possible, and, in the case of the latter, unless disbudding is practised with no light hand, both the shape and substance of the blooms suffer to a remarkable degree. H. E. Richardson is a Rose which I have always considered inferior to several others of its colour. Under normal conditions of stiff, rich loam, its propensity for useless, lanky growth and scarcity of bloom is so strong that one wonders that there is still any demand for this Rose. In light soil with abundance of leaf-mould, and under light pruning, these faults are, to some extent, corrected; nevertheless, there still remain to this unsatisfactory Rose the apparently incurable tendency to flatness and discoloration of bloom.

Many growers now omit from their lists the old Rayon d'Or. It has, without a doubt, been rightly superseded. Nevertheless, there are gardens where it is still to be found amongst the more elect and where one is loath to part with it altogether. It will, of course, always have flat blooms, but it can easily be more free in their production and more satisfactory in general growth than it sometimes is. In many gardens, it is simply murdered, every spring, as the knife goes round in March in the usual haphazard "en masse" pruning operations! Beyond removal of dead and ill-placed wood and the merest shortening of the shoots retained leave it alone! Give it really stiff, rich land, and if you are on the point of discarding it you will probably decide otherwise, if only for its colour, which, at its best, is superb. Betty Uprichard (I am not yet convinced that it should be U-prichard, and should be sorry to saddle so delightful a thing with so awkward and ill-sounding a name!) is admirable in every way save, perhaps, its paucity of petals. I grew it first under normal conditions of soil and pruning, with the result that its growth was tremendous, but its blooms, though of good colour and substance, sm
than I expected. Since then I have
another batch in considerably lighter
with only moderate feeding, and pr
rather less severe than is customary,
need no further proof that these are the
ditions conducive to perfection in this
ideal Rose.

Those close relations and rivals, O
and Mme. Butterfly, seem uniformly
factory under almost any conditions. I
my best results, however, have been i
tinctly heavy soil, much heavier th
usually suggested for the Hybrid
though I have not observed that feedi
any extent is necessary to perfection in e
On the other hand, I am quite sure on
do no good at all with Sunstar, a Rose
has caused much disappointment, unles
can give it the most liberal treatment,
it, indeed, to excess. Lady Roundw
fancy, gives a much better bloom, in
stance and size, if pruned rather
severely than is usual to members
class, and the same may apply to Lady
together with the fact that this Rose is
so good as it might be unless given
liberal treatment, with a stiff soil as fo
tion.

G. C. Waud, which, for its distinctne
colour should be in every collectio
another which responds most readily to
ing and a heavy loam, and seems to giv
most perfect blooms without reductio
freedom if rather heavily pruned. With
Aaron Ward, on the other hand, I wou
sparing with the knife, but equally l
otherwise. And there seems to be bu
way of having much of Christine's be
and that is by giving it up as a "bu
for which its growth is too weakly
short, and elevating it to the dignity
"standard," a form in which Lady Hi
don is also superior. A little more knife
usual, but not too rich ground, seem to
the latter as well.

"En masse" planting, as carried o
so many gardens, is simply courting
pointment with three Roses I have
down as decidedly "bad starters,"
Marcia Stanhope, Clarice Goodacre,
Lord Charlemont. Unless the greatest
is exercised in choice of ground and cli
conditions, in placing plenty of dry, f
loam among the roots and immediately
them, and in avoiding the slightest vari
in depth of planting compared with the
vious insertion, losses are almost sure
sult, and will, indeed, do so, to some ex
whatever one does. Once established, M
Stanhope prefers very moderate cutting
whereas, unless Clarice Goodacre is
hardly treated in this line and given "s
thing of the best," the blooms will be
ridiculously small. Prince de Bulgari

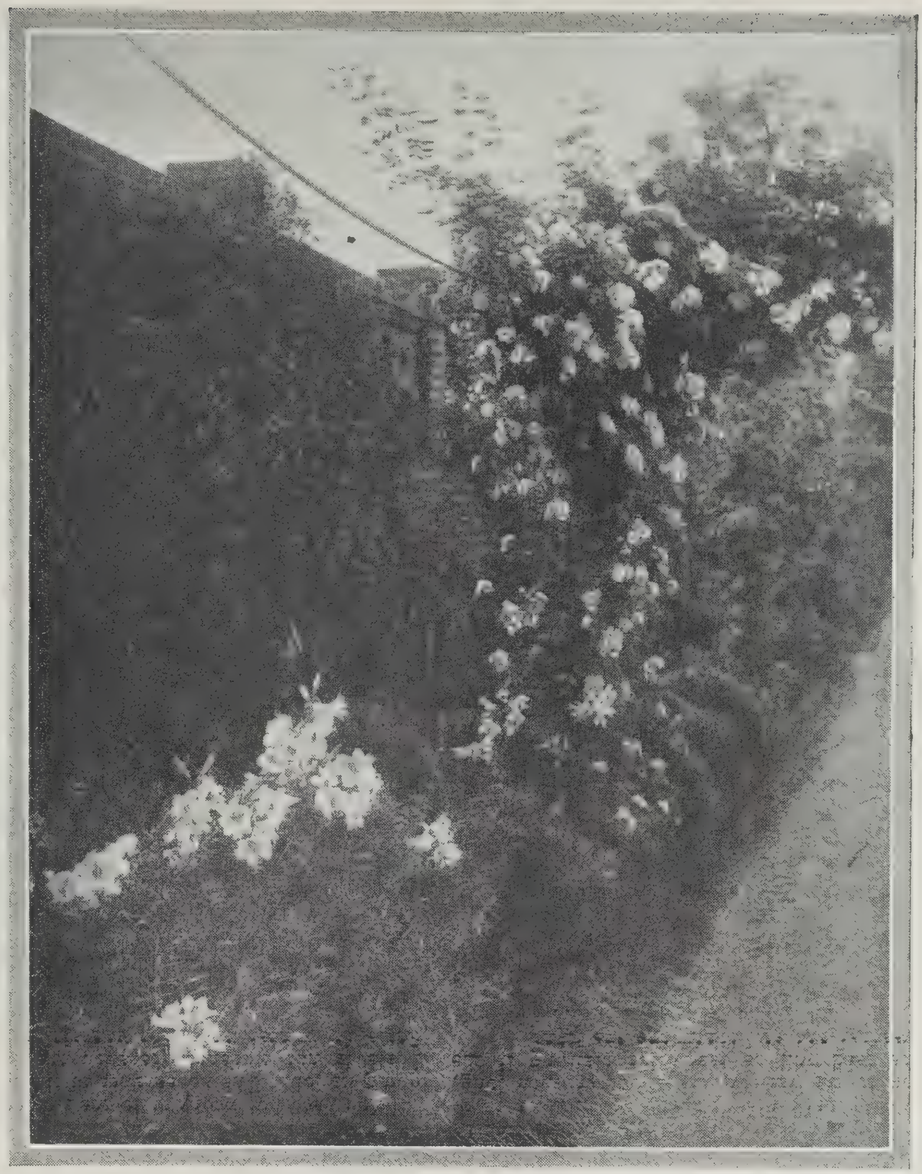
we are prone to be, to write down
this or that Rose as a "disappointment," a "failure," a "bad doer," or to be "scrapped" at the first opportunity, ere we have given them the chance they require to show their real worth. Certainly, the greater our individual intimacy with our Roses, their particular weaknesses, inclinations, peculiarities, the more clearly shall we realise that many Roses are much "better" than they seem, that there are very few Roses, indeed, which are not a sheer delight, and fewer still which are not worth growing. J. R. K.



Madonna Lilies and Rambler Roses

Arenarias

The Arenarias or Sandworts are extremely pretty little Alpine plants calling for a minimum of cultivation. Most of them thrive in sandy soils and sunny positions, though some of them prefer moist and partially shaded positions. Most of them spread freely and rapidly, affording a ready means of propagation by division, but propagation by cuttings and seed is also readily effected. A. balearica is a gem of the race, and is excellent for covering moist walls or rocks, to which it clings closely, forming a dense carpet of tiny leaves. Above these, borne on slender pedicels, appear myriads of tiny white, starry flowers, which maintain their attractiveness during a long period in the summer.

A. Ledebourii is a neat little Sandwort with minute rosettes of tiny bluish-grey leaves surmounted with miniature sprays of small white flowers.

A. montana is a large-growing species forming trailing masses of grey-green foliage. It bears large snow-white flowers from June onwards, and is an excellent subject for the sunny rock garden, where it trails gracefully over large rocks, covering them with attractive foliage and almost campanulate flowers.

A. purpurascens is a tufted, decumbent plant of perfect habit and the only member of the genus with distinctly coloured flowers. In July and August its little tufted mounds of small leaves are studded with tiny flowers of a lovely shade of lilac. It prefers a moist situation, and if planted in dry, stony positions it should be given liberal supplies of water in periods of dry weather.

A. tetraquetra is less floriferous than some other species, but an interesting plant. The ovate, recurved leaves are imbricated in four rows, giving the plant a distinctive appearance. It grows freely in ordinary light soil, producing its somewhat capitate flowers in August. A. Saxifraga is a satisfactory plant for sunny positions, its somewhat rounded leaves and large white flowers being attractive.

W. AUTON.

REMINDERS FOR THE WEEK

Southern and Midland

Vineries

The early Vines will now derive much benefit from weekly applications of diluted manure-water, or if such is not available one of the excellent artificial Vine manures should be used about once each fortnight. Whatever is used it will be advisable to entrust its application to skilful hands only, otherwise more harm than good will result. Weak applications should be given to commence with, a slight increase in strength being applied in successive waterings. With artificials some good growers favour scattering these over the surface of the border and watering it in, while others mix the desired quantity with water beforehand and dilute as required. Personally, I prefer the former method, and it is often delightful to see the little white feeders perforating the surface in search of it about a fortnight after its application. Tying, stopping, and gradual training of the shoots will require almost daily attention, this being a delicate job which, if hurried, will most certainly end in disaster by the shoot breaking from the rod.

Peach houses

Growth here is rapid, and the training of the young shoots must receive almost daily attention. Where there is a danger of the trees becoming crowded a portion of the shoots should be pinched back, but if the disbudding was carefully performed, the amount of stopping necessary should be small. A weak application of liquid-manure will benefit trees, swelling their fruit, and careful observation must be given where there is the slightest suspicion of Green Fly attacks, and should their presence be noted the house should be fumigated at once, otherwise many of the fruits will be disfigured.

Peaches in the open

These are now in bloom and must, unless bees are plentiful, be hand-fertilised at midday. A rabbit's tail answers the purpose well, and should be lightly drawn over the blooms to distribute the pollen when the latter is quite dry. Protect the trees at night and thus prevent loss from frost, the coverings being drawn aside during the day. Apricots and choice Pears should receive similar attention, otherwise a portion at least will be lost.

Stove and greenhouse plants

Growth is now rapid, and at the present time this should, especially among stove evergreens, be encouraged by weak applications of manure-water and early closing of the houses, together with a free use of the syringe, which not only assists in producing the necessary moisture in the atmosphere, but keeps down plant pests.

Shading plant houses

Wherever possible blinds should be fixed for this purpose, as during dull weather they may be rolled up and thus admit full light to the plants. It often happens, however, that a permanent form of shading is the only alternative, and where this is so no time should be lost in getting it on, as too much air applied to keep down temperatures is not always favourable to plant life.

Perpetual flowering Carnations

The plants are now making rapid and strong growth, flowers are abundant, and no harm will arise from a damping down of the paths on bright mornings, together with a light spraying of the plants on favourable occasions. Careful watering and feeding is important, and though free ventilation should be given, I would much rather see the houses rise in temperature, within reason, than to admit cold draughts to the plants. The young stock will benefit from light overhead spraying on fine days, and free ventilation should be given. Many of these will require stopping, and many will require a shift into larger pots.

Newly planted trees and shrubs

Examine these at intervals and soak any showing dryness at the root. Scarify the surface soil, and wherever possible apply a generous mulch of decayed leaves or other litter.

Sweet Peas

Sown in pots in the autumn and wintered in cold frames, these are now ready for their permanent positions, which should have been thoroughly prepared beforehand. Care should be taken that before planting out they are in a moist condition and well watered in after planting. It will also serve as a little protection from cold winds if short twigs are placed alongside at once.

Vegetable Marrows and Indian Corn seeds

These should now be sown to furnish plants for the open in May. The former may be sown singly or in numbers in pots and the latter in boxes or pans, the resulting seedlings being potted up separately when 3 inches in height. The latter gives a delicious food which is much appreciated here, and is planted in the open about May 20th.

Salads in frames

These have been plentiful and excellent, and must shortly be succeeded by those which have wintered in the open, therefore encourage these by frequently stirring the soil around them and by the application of a light stimulant. E. Markham.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Grape thinning

This tedious but very necessary operation should be carried out, as far as possible, during dull days, for double the amount of work can be carried through when the operator is in a fairly comfortable state and not unduly heated. It is always well to thin Grapes while the berries are still quite small.

Tomatoes

The main batch of these are now ready for their fruiting quarters, whether to be grown in beds, boxes, or pots. A good, fresh compost is desirable in any case, but it is a mistake to make it very rich, this causing undue leafage and stem at the expense of fruit. Unless the loam be of very poor quality use no animal manures, but a fair amount of bonemeal is good, and a liberal quantity of dry wood-ashes almost indispensable. In all cases make the soil quite firm.

The Melon house

With the lengthening days Melons are making more rapid progress and so demanding frequent attention in the way of tying, pinching, and watering. To prevent attacks of vermin a moist atmosphere must be maintained in the house.

The Peach house

Dryness at the roots is fatal to success with the Peach as is a dry, warm atmosphere, so damping down must be attended to at least twice a day and the soil kept moist. Continue the disbudding of the later houses and tie down the shoots as often as is necessary in the early houses.

Pot on seedling Cyclamens

If the 2-inch pots are well filled with
but not unless, it is desirable to now
shift into those of a larger size. In th
of the strongest of the plants 4-inch pot
be given, but all weaker ones should ha
3-inch or $3\frac{1}{2}$-inch. The compost sho
composed of the best fibrous loam, swe
mould, and sufficient clean, coarse s
ensure a free passage of water. A
thoroughly decomposed manure m
added, but strong artificial fertilisers
be avoided at this stage. Do not p
firmly. Return to same temperature,
from all sunshine, and maintain a nice,
atmosphere in the house or pit.

Planting shrubs

During the next few weeks is a ver
able time for transplanting Hollies, L
Yews, and Hybrid Rhododendrons, th

Shakespeare Garden and Its Plants

NY readers will have read with in- t-est, as I did, the short article titled " Flowers for a Shakespeare " by E. J. Ellis, which appeared in ue of March 2nd. The following were mentioned:—Aconite, Lily, l, Poppy, Rose, and Violet, but this t be well extended. The ambitious en plant a Myrtle Grove (or at least), to which Shakespeare alludes in and Adonis." "The sombre Yew " might find a place and also the Vine, to clothe a "covert alley." In V." the last-named is referred to

er Vine, the merry cheerer of the
heart
npruned dies; her hedges even
pleached,
ke prisoners wildly overgrown with
hair,
ut forth disordered twigs."

dor gardens a low wall or hedge was ly introduced where "Rosemary for rance" grew.

he Tempest" Ariel sings:—

errily, merrily shall I live now
nder the blossom that hangs on the
bough."

Were these, as many suppose, the flowers of the Lime trees so often trained to form a shade walk in those days? Apple trees must certainly be included, which are alluded to in "Henry IV." The Mulberry is thus referred to in "Coriolanus":—

"Thy stout heart
Now humble as the ripest Mulberry
That will not hold the handling."

May trees are delightful in every garden, and in "A Midsummer Night's Dream" we read of the time

"When Wheat is green when Hawthorn
buds appear."

To clothe the garden house or to shade a seat we have the fragrant Honeysuckle, for in "Much Ado About Nothing" the poet mentions:—

"The pleachèd bower
Where Honeysuckles ripen'd by the sun
Forbid the sun to enter."

We may, perhaps, be excused for quoting the familiar lines from "A Midsummer Night's Dream":—

"I know a bank where the wild Thyme
blows,
Where Oxlips and the nodding Violet
grows,
Quite over-canopied with luscious
Woodbine
With sweet Musk Roses and with
Eglantine."

The Eglantine, it may be recalled, was the charming old name for the Sweet Briar,

"the leaf, whom not to slander,
out sweeten'd not thy breath."

Although Shakespeare makes mention of the "bold Oxlip" several times, he does not forget the more fragrant Cowslip, for in "The Tempest" Ariel sings again:—

"Where the bee sucks there suck I;
In the Cowslip's bell I lie."

The more simple the flower the more beautiful seems the picture which the poet conjures up for us. In "Love's Labours Lost" the Daisy is thus referred to:—

"When Daisies pied and Violets blue,
And Lady-smocks all silver-white,
And cuckoo-buds of yellow hue
Do paint the meadows with delight."

Then we read of the Daisy again compared to the hand of the sleeping Lucrece:—

"Without the bed her other fair hand
was
On the green coverlet, whose perfect
white
Showed like an April Daisy on the
grass."

Another humble flower is recalled in the line :—

> “ The azured Harebell like thy veins.”

The words put into the mouth of Ophelia, although so familiar, cannot be left out :—

> “ There's Rosemary that's for Remembrance,
> Pray, love, remember :
> There's Pansies that's for thoughts.”

Ophelia also exclaims :—

> “ There's Fennel for you and Columbines,
> There's Rue for you ; and here's some for me ;
> We may call it Herb Grace o' Sundays.”

In “ Much Ado ” the handsome variegated Thistle is mentioned thus :—

> “ Get you some of this distilled Carduus Benedictus and lay it to your heart ;
> Why Benedictus? You have some moral in this Benedictus !
> Moral ! No, by my troth I have no moral meaning,
> I meant plain Holy Thistle.”

It is thought the “ Gillyvor ” referred to in “ Cymbeline ” was the Wallflower, but the Stock was also known by this name. There was also the Clove-Gillyflower, or the Coronation (Carnation), so let us take the advice of Polixenes to Perdita :—

> “ To make your garden rich in Gillyvors.”

In the “ Winter's Tale ” a host of flowers are referred to :—

> “ The fairest flowers o' the season
> Are our Carnations and streak'd Gillyvors.” . . .
> “ Here's flowers for you,
> Hot Lavender, Mints, Savory, Marjoram ;
> The Marigold that goes to bed with the sun.” . . .
> “ I would I had some flowers o' the spring ; Daffodils
> That come before the swallow dares ” ;
> . . . Pale Primroses
> That die unmarried ere they can behold
> Bright Phœbus in his strength ; the Crown Imperial ;
> Lilies of all kinds, the Flower-de-Luce being one.” (*Compiled*).

The allusion to the white Flag Iris is an important one to those who would plant such a garden as that suggested. Let us end with this apt quotation :—

> “ I doubt this garden lacks no flowers to make a garland of in any season.”

Such is the garden that Sir Francis Bacon wrote of and Shakespeare sings of, a place for strengthening the weary spirit, for youth's fond dreams and maiden's fancies, for lovers' whispers, for children's gambols, or for the telling of some wondrous fairy tale, with the murmur of the stream, the sighing of the breeze, the song of the birds, and the hum of the bees to soothe and refresh us with their music.

May such a garden, like Shakespeare's Rosemary and Rue, ever “ keep its seeming and savour,” and be to all who enter it “ Full of Grace and Remembrance.”

H. H. Warner.

Gentiana sino ornata

Few new plants have come through the winter better than this fine Gentian, which should now be lifted and divided up. One nice plant will easily furnish 30 good planting pieces. It is one of the easiest plants in the world to divide, the little parts coming away as independent units and ready to replant at once. A mixture of loam, leafmould, peat, and sand will be found to suit this Chinese beauty admirably.

Perpetual Carnations

April is the month when the Carnation is once more in full growth and the period when the tide should be “ taken at the flood.” The rapid growth which it makes should in no way be checked.

Flowering plants in particular must be fed either by one top-dressing of Cartion Fertiliser or liquid-manure water given twice during the month. So quickly do the growths develop that if plant supports are not used one must take care to see that the growths are tied in good time ere they fall and break.

Every good cultivator has his insecticide in stock, as one day's delay in attacking Green Fly means the spoiling of one's plants. The leaves of a Carnation which have been punctured by Green Fly never recover, and this is the first stage towards disease.

The new Carnation Kathleen, deep salmon (Award of Merit)

With young plants it must likewise be the aim to keep them on the move, and any in 2-inch pots soon require an immediate shift into a size larger, while the earlier batches should likewise be potted into a 5-inch pot.

Stopping, if possible, should be done a couple of weeks after repotting, as the plants break more freely and receive less check. With regard to stopping, the fact that all varieties do not grow alike makes it interesting to observe the best way to do it. The short growers, like White Pearl, if stopped rather high (that is to say, if the growth is broken out at about 6 inches) make a good plant from this one stop, bloom earlier and more freely if all the shoots are not stopped again. Should, however, a growth be running off to bloom in August this may be broken back if early blooms are not required. While the one stop applies to the minority of varieties it is the best method with all the dwarf growers, which include Lady Inverforth and Countess of Harewood.

Not the least among the pleasures of grow-
ing Carnations comes at this seaso
year, when the sun stiffens up the s

by Ernest Benn, Ltd. ; price, 2s. 6d.

is why they exhaust it so thoroughly. are as manifold as the hair on one's iough the habit of the plant is not would suggest the need of so many, ier its foliage nor blooms appear to ng, but, presumably, it is because of nificent underground system that it rish and bloom in poor and shallow ough not up to market standard. To his, a deep and fairly rich soil is y, as also is moisture, and where n be provided, flower stalks from s to 24 inches are produced, sur- by blooms of first size and quality.

are several ways of working up a ck of plants, the readiest and easiest ng to grow plants from seed—but either the best nor the most economi- e end; for while quite a good strain so raised, there is always a good pro- not up to market standard, and are, , unprofitable. Further, there is no e of colour, and as the market will e certain colours, which must be distinct from each other, the others be weeded out and scrapped. On the nd, certain plants of outstanding night form the nucleus of a big increased by the methods to be de- irectly. We do not, therefore, decry ig of stock by seeds, though we have but its disadvantages. It must also that only single varieties can be orily raised from seeds, so that the of propagating by some other ds very apparent.

gation by cuttings is resorted to, haps by nurserymen than by market These are taken in April, cut off he base, and inserted in pots or pans soil. They are then given the pro- f a cold frame with lights, and kept l and shaded for about a month, ey are beginning to root, and may ed. Later they are either potted off d out in nursery beds.

te almost universal way of increasing by lifting and splitting up the plant, is done either in August or March l. The August splitting has tremen- antages if the weather is favourable; is a time of drought, then it should be deferred till the spring. Its especial advantage lies in the fact that the plants become well established during the autumn and produce a crop of flowers of good quality the first season, while those split up in March or April give a much smaller and poorer crop, especially if the harsh cold winds prevail (as they often do) for weeks. An August like that of 1928 is ideal for the purpose, bad though it has been for others.

The splitting up is undertaken when the plants are on the move, and only then with perfect safety. In the spring they are making their start after the winter's rest; in August they are active after the crop and making their autumnal growth. To split them up when they are inactive often means their loss through rotting.

The beds must be thoroughly well prepared. A liberal dressing of manure must be worked in, and the soil thoroughly disintegrated to a fair depth. The better this work is done, the more profitable will be the results, keeping in mind the fact that the plants have to stand three years, that they are heavy feeders, and that there are no means of getting beneath the roots for the whole of that period. Top dressing, both for second and third years, is necessary.

There are many varieties of single and double flowers; but though they may all find their place in garden adornment, the market grower will naturally select about a dozen of them as embracing the best for his purpose. We offer here a selection, though probably another dozen, equally meritorious, could be found if necessary. Singles: A. M. Kelway, rose; Comet, crimson; Elsie Gertrude, pink; James Kelway, crimson-scarlet; Queen of Whites, white; Firefly, crimson. Doubles: Aphrodite, white; Captain Nares, crimson; Princess Beatrice, pink; Haage et Schmidt, carmine and rose; La Vestale, blush; Marquise de Stella, rose; Queen Mary, shell pink.

Narcissus lobularis

Perianth sulphur, trumpet yellow. It is commonly grown under the name Narcissus nanus

An uncommon edging

In recent years there has been a tendency to do away with Boxwood edgings. There may be several reasons for this. Some have the idea that it harbours slugs, others object to it on the ground that it requires to be trimmed in late spring when other work is pressing, and in many districts it has the unsatisfactory habit of dying out in patches. Many other subjects have been tried with varying success. A very uncommon and entirely reliable edging is Cotoneaster thymæfolia. This is one of the hardiest shrubs growing, and can be clipped to any height required, from a dwarf edging of a few inches to a hedge of 3 feet or more. It is easily propagated from cuttings inserted in autumn, and should be planted the following season about 4 inches apart. It will soon become established and make rapid growth. Care must be taken to have it cut hard back in order that it may form a close, thick hedge. Unlike Boxwood, it may be clipped during hard weather in winter. Those who are making new gardens or renovating old ones ought to give this beautiful grey edging a place. TEVIOTSIDE.

Narcissus nanus (true) in foreground, shown on April 9th by Barr and Sons

Flowers rich full yellow and very dwarf

Lonicera nitida

This comparatively new shrubby Honeysuckle is a beautiful and charming plant, a wonderfully free grower, and an excellent subject for planting in the shrubbery or as a plant in the formation of a hedge. The shrub is evergreen in character with small, dark, glossy, green leaves, and of a compact habit of growth. The general aspect of the plant is exceedingly pleasing with its slender, erect shoots and dense foliage. It grows to a height of 3 feet to 5 feet.

This shrubby Lonicera is a native of W. Szechuen and Yunnan, China, at altitudes of 4,500 feet to 7,000 feet. It was introduced by Wilson in 1908. The plant is perfectly hardy and should grow practically anywhere in this country. It is also a shrub specially adapted for seaside planting. It is, however, as a low-growing ornamental hedge that this delightful shrub will probably be found to be most useful. When contemplating the formation of a hedge of this Lonicera it is advisable to prepare the ground by trenching or bastard trenching, about 3 feet to 3½ feet in width, some time previous to planting, allowing it time to settle before putting out the plants. Though it will bear close clipping there is something to be said in favour of lightly trimming a hedge of Lonicera nitida and thus retaining the natural graceful habit of the plant at all seasons. J. L.

Potentillas

The large number of Potentillas which are eligible for the herbaceous border are useful as unrivalled plants for inclusion in a narrow border where very tall plants cannot be used. They also make good front row plants for a large border. The culture of Potentillas is not hard, and the plant is best seen in bold groups rather than small clumps. All thrive in good garden soil. Where possible they should be grown in bold groups, for they thrive better if so placed than as solitary plants, and no plants have a finer effect in a border by themselves. The Potentilla may be had in many forms, but my favourites are the old single forms, which often show such shading in their colours. The flowers are 1 inch across and in clusters at the end of each branch. The branches are 18 inches high and very slender, so that if unsupported in their early stages of growth they will fall to the ground. Such neglect will be almost impossible to repair when the flowers are nearly developed, as branch after branch will break away in tying. The prime favourite with most growers is Gibson's Scarlet, a strong variety that runs 2 feet in height. Other good kinds running to about 18 inches in height are:—P. argyrophylla, with greyish leaves and orange-yellow flowers; P. Thunbergii, crimson-maroon; P. nepalensis Willmottiæ formosa, salmon-pink; P. pyrenaica, yellow. Propagation is effected both by division of the root and sowing of seeds. H. Stevens.

A refined self yellow Incomparabilis, the stock of which was acquired by Mr. R. F. Calvert

Shown by Mr. J. L. Richardson, Waterford

Narcissus juncifolius, a sweetly scented species from the Pyrenees and Montserrat (Spain)

Shown by Barr and Sons

Alpines in Greycoat Street

Miniature rock gardens and Alpine plants have been well shown at recent meetings of the Royal Horticultural Society.

The competition for the Sewell medals for six pans of Alpines brought keen competition. Two of the best plants in competition were the tiny but lively and brilliant reddish-pink Androsace ciliata and the rare Fritillaria Karadaghensis, shown by Mr. R. Bevan, Henley-on-Thames. Good pans of Shortia uniflora grandiflora, Saxifragas Faldonside, Burseriana speciosa, lilacina, Primula Allionii and its white variety from the Alpes Maritimes were shown by Mr. C. Kirch, of Beckenham.

Many good pans of the pink-flowered Saxifraga Jenkinsæ were noted. Probably the most floriferous pan was of S. Burseriana Gloria, with well over 300 flowers, shown by Casburn and Welch, who also staged S.S. Burseriana, sulphurea, Irvingii, and Paulinæ.

Mr. Clarence Elliott showed representative collections in which Saxifraga Griesbachii, S. apiculata, and S. a. alba were in evidence.

Of the small Narcissus suitable for rock gardens reference should be made to N. nanus (true), shown by Barr and Sons, and the sweet-scented N. juncifolius from the Pyrenees.

Unfortunately, many exhibitors have been showing N. lobularis under the name N. nanus, though the two are distinct. H. C.

Saxifraga Irvingii

This resembles a silvery Moss in the dwarfness of its tufts, and in dry, gritty, or sandy soil spreads into neat cushions from 3 inches to 6 inches across.

It grows only 1 inch high and bears very large flowers for its size. These appear above the leaves and rise well above the foliage. The flowers are rich carmine and borne singly on slender stems in March. It is a plant for the rock garden in dry,
spots in well-drained sandy soil. G
broken limestone may be mingled wi
soil, but if there is plenty of sand this
essential; a few pieces half-buried in t
will guard the plant until it has take
and also form a key to subsequen
dressing. Frost, wind, or wet seldo
any damage to the flowers, which co
the same freshness all through thei
flowering season. Being minute, th
consideration should be to keep it fr
distinct from all neighbours. It is a va
plant, being hardy, dwarf, neat in habi
fuse in bloom, forming gay cushions
moraine or silvery tufts from the chi
rocks.

Story of the Anemone

The seventh of the evening discu
arranged by Dr. W. F. Bewley (D
of the Experimental and Re
Station, Cheshunt) and held in the
Hall, Elm Arches, Cheshunt, was deve
a talk by Mr. E. A. Bowles, M.A., Wa
Cross, on "Anemones." Mr. J. C.
occupied the chair. The Anemones, sa
Bowles, were a very interesting ra
plants, and very simple in their constru
thus pointing to the fact that they wer
bably one of the oldest races. They bel
to the Natural Order Ranunculacea
Buttercup family, but were even more
constructed than the common Butt
The member of the Buttercup family n
to the Anemone was the Lesser Cela
Ranunculus ficaria. Anemones were
found all over the world, although they
represented by one species only in Tas
and three in South Africa. Going on
scribe the similarity in construction be

Saxifraga Burseriana Gloria

Shown by Casburn and Welch

would seem probable that it was from the Anemones that some of these genera began. In looking round for the oldest species or parent stock of a genus it is usual to look for one which has a greenish or yellowish flower. Thus the yellow-flowered A. palmata, a native of North Africa and Spain, and A. ranunculoides, which is very like a Buttercup, probably represent the oldest forms in two races. Both these species have an attempt at a second flower, but are not generally branched. Branching in Anemones probably began with A. multifida, and this leads to A. japonica and other much-branched forms. The Japanese A. flaccida connects A. nemorosa with A. rivularis and A. obtusiloba.

Where the Anemone occurs wild it is usually plentiful. A. occidentalis covers miles of mountain-side in America, while A. alpina, A. sulphurea, and A. stellata are found in masses in their native countries. The most beautiful of all Anemones is A. alpina.

In his concluding remarks Mr. Bowles dealt with the mythology connected with the Anemone. Usually associated with Adonis, the Anemone, or Adonis flower, was said to have sprung from the blood of Adonis when he was slain by a wild boar. The story was known best from the Greeks, but could be traced right back to the Phœnicians. On the northern slopes of Lebanon was the valley of Adonis and the Adonis river. There also was found Adonis' grave. It was probable that this place was the origin of the Adonis cult, and that it was brought to Greece by the Phœnician traders. The derivation of the name Anemone was interesting. It was generally connected with the Greek *anemos* meaning the wind, and the " wind flower " was a name in common use. It was probable that the Phœnician name was the Syrian for Adonis, which was Naaman, and the similarity of this word to the Greek *anemos* led the Greeks to give this name. Pliny tried to explain it by saying the plant was given this name because the flowers only opened when the wind blew. This was a very poor explanation, because the flowers were usually closed when such weather was prevalent. Others said it was so called because the wind scattered the seed. These explanations were rather like Archbishop Trench's instance of a false derivation that the goat was so called because it will " go at you."

The Red Sage

This Sage differs from the ordinary green variety in the colour of its stems and foliage. These are purplish-red, but, being thickly covered with grey down, the impression retained by the eye is that of soft dove colour rather than red. It is very useful for special places, such as dry banks, its unique colouring harmonising well with other plants. In the variety tricolor one half of the leaf is a peculiar shade of mauve-pink, occasionally blotched with yellow, a well-coloured specimen is a very beautiful object. Like the common Sage, it can be easily propagated at this season. Select shoots about 9 inches or 10 inches in length and insert them in prepared ground with a dibber to a depth of 6 inches. If made quite firm they will soon root and form good plants. Care must be taken to select the best-coloured branches for cuttings, otherwise the plant will soon revert to type.

Men of old considered that the use of Sage conferred longevity! Miss Rhode, in her " Garden of Herbs," has collected many quotations to prove it. " How can a man die who has Sage in his garden? "—Arabian Proverb. " He who would live for aye must eat Sage in May."—Old English Proverb.

Sir John Hill, writing of his garden at Bayswater, says that " the common red Sage has the greatest virtue," and that " Sage properly prepared will retard that rapid progress of decay that treads upon our heels so fast in the latter years of life, will preserve the faculties and memory, . . . will long prevent the hands from trembling and the eyes from dimness, and make the lamp of life, so long as Nature lets it burn, burn brightly." J. COMBER.

Nymans Gardens.

Taking cuttings of Sage (Salvia officinalis)

Although the use of herbs has become less general of recent years, the Sage is still in request, especially in autumn and winter. Plants can be raised from seed, but naturally it is saved from specimens which produce seed freely, and, because of this, have a more or less biennial character, often dying out when most needed. It is, therefore, wise to obtain a good leafy variety, one that flowers but seldom, and then propagate it by cuttings.

Many years ago Mr. Beckett, of Aldenham, advised the insertion of rather long cuttings in the open ground at this season. We tried the plan and found it so satisfactory that it has been practised here ever since. The ground is prepared, three or four cuttings are pulled off with a heel, the soil is drawn back with a spade, the cuttings inserted together up to the leaves, and the soil trodden back firmly on to their bases, levelling it afterwards to form a tilth on the surface. If placed at 1 foot apart a close bed of foliage will be obtained before autumn.

Nymans Gardens. J. COMBER.

Seed Potatoes: A selection

A "true stock" or a "clean land" certificate is required in the case of a sale of all Potatoes for seed. The "true stock" (T.S.) certificates are given for crops of varieties immune from Wart Disease which have been examined while growing and found to be of nearly 100 per cent. purity. The "clean land" (C.L.) certificates are given in cases where the land in which the crop was grown is known to be free from Wart Disease, or, alternatively, where the seed Potatoes themselves have been examined and found to be free from that disease. Growers who want to sell seed Potatoes and have not yet obtained their C.L. certificates should apply at once to the Ministry of Agriculture for them. It is, of course, better in all cases that certificates should be given after examination of the growing crop, and growers of Potatoes for seed are advised to have their crops annually inspected for purity. The true stock certificate means more than the clean land certificate, and should assist growers to obtain a better price. Buyers must see that the number of the certificate, with the other necessary particulars, is supplied to them by the seller in accordance with the law.

In selecting varieties for planting, the results of the recent trial of varieties by the Ministry of Agriculture may be useful. Generally speaking, the following were the best amongst the First Earlies:—Epicure, Sharp's Express, Immune Ashleaf, and Dargill Early. Among the Second Earlies:—Arran Comrade, Great Scot, and Ally. Main Crops:—Kerr's Pink, Majestic, Up-to-date, Arran Chief and Arran Consul, and King Edward. Kerr's Pink has cropped particularly well.

In boxing and sprouting seed before planting, the best approved method is, briefly, as follows:—Place the seed in shallow boxes with the crown or rose end uppermost; put the boxes in a shed with plenty of light but no frost. If that is done, only the strong eyes will sprout. When the sprouts, which will be dark green, purple, or blue, according to the variety, are about an inch long, the seed will be ready for planting if the weather and soil conditions are right.

Report on condition of horticultural crops on 26th March

Beans and Peas (autumn-sown).—Severely damaged by frost nearly everywhere.

Broccoli (Spring Hearting).—Excellent heads reported from Cornwall; elsewhere much frost damage and prospects are poor.

Cabbage (autumn - planted). — Much damaged by severe weather and crops will be very late.

Cucumbers (under glass).—Satisfactory generally.

French Beans (forced).—Satisfactory; considerable improvement reported from Sussex this month.

Lettuce (frame).—Fair generally, but below average in Sussex.

Lettuce (outdoor).—Damage by frost has been severe generally, and in some places only a small proportion of the crops has survived, and this will be late.

Mint (forced).—Satisfactory.

Parsley.—Below average.

Radishes (forced).—Average.

Rhubarb (natural).—Growth very backward; crop will be late.

Seakale (natural).—Backward.

Spring Onions.—Growth delayed; present prospects no more than fair.

Tomatoes (under glass).—Growth checked by weather, but considerable improvement recently.

Anemones.—In Cornwall sheltere are flowering well; picking still in p in Scilly Isles.

Arum Lilies.—Some foliage dam Cornwall; good in Herts, but below in Sussex.

Carnations, Perpetual (under g Satisfactory in Herts, but below ave Essex, where bloom is slow in openin

Daffodils and Narcissi (indoor).—Ge satisfactory.

Daffodils and Narcissi (outdoor).—I Isles Emperor, Empress, and other crop varieties are in full swing, Ornatus will be available very s Poeticus a full crop. In Cornwall are coming in slowly. Elsewhere cr very backward, though prospects ha proved very much recently.

Hyacinths (forced).—Satisfactory.

Roses (under glass).—Satisfacto Herts, but below average in Essex.

Tulips (forced).—Good average crop

Violets.—Flowering well in sheltere tions in Cornwall and Devon, but se damaged by weather in exposed place ticularly in Sussex. Reported fair in

Wallflowers.—Good in Scilly Isles; ward in Cornwall; elsewhere the cr been severely damaged. In some pl has been ruined.

Answers to Queries

Questions—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent each should be on a separate piece of paper, the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, cannot always be replied to in the issue i ately following their receipt. We do not r queries by post.*

Naming plants—*All who wish their pl be named should send fair examples of ea stem, leaf, flower, or fruit. (Snippets of and points of shoots are useless.) Not mo four plants should be sent in any one week same correspondent. Where more than on is sent they should be numbered. Of conif cones should always be sent.*

FRUIT

Apples not fruiting

I have an orchard planted about 12 years ago with Grenadier, Bramley Seedling, and Lane's Prince Albert. The trees were well planted, and each year are covered with bloom and fruit buds. We never have a good crop, though the trees are pruned and clean. Any Apples borne drop off the size of Chestnuts. A. LENDRUM.

Corkil Kilskerry,
Co. Tyrone, Northern Ireland.

[The flowers must be insufficiently pollinated, probably opening very early and before many insects, especially bees, are about to discharge this important function. Of course, spring frosts while the trees are in bloom would have the same effect. Under such conditions it is difficult to advise a remedy. We think, however, that you may be pruning too severely. Ordinary orchard trees require but little of this, an odd branch being removed where there is fear of overcrowding or where the balance of the tree is to be impaired being, usually, sufficient.]

Mussel Scale

I have an Apple badly affected with Mussel Scale, and was advised to use Abolene tar-wash. The tree was sprayed with a 10 per cent. solution at the end of January, but the wash appears to have failed, because the scales are still in position and look as good as ever. JOHN.

[You need not worry as to the Abolene not doing its job. The appearance of the Mussel Scale is not evidence, because the Mussel Scale in winter does not contain a living creature. In autumn, under the old tive scale, the old female scale lays a n of eggs and then shrivels up and di you carefully examine a "scale" durin ter with a good glass the old skin of th *plus* her egg-laying efforts, can be Tar oil washes penetrate the old scal many of the eggs are killed. Please se to F. Trollope.]

—— I enclose a portion of Appl (Worcester Pearmain) which I beli affected with scale. As it is an old about 15 years I should think—and g amongst an orchard of half-standards two years ago I am prepared to upro burn it if you think it advisable. The trees are quite clean at present. Woul sulphur kill the pest, or any spray? trunk of the tree is simply covered. trees were sprayed with Mortegg in Ja F. TROLL

[You are correct in stating that your tree is affected with Mussel Scale. tree was sprayed with Mortegg in J most of the eggs beneath the old scal be killed, but with such a bad attac must not expect complete control at th attempt. Spray again the first week i with a good nicotine wash, because that period any eggs not killed will In the immature stage the pest is killed. All your trees should be spraye a tar oil wash each season, and such ment should in future keep your trees paratively free from insect pests. We point out that it is important to use th mer nicotine spray not later than the the first week in June; if applied later Scale is difficult to kill. If the w ut earlier the eggs are safe under scales and nicotine wash does no lortegg, on the other hand, pene- scale and the eggs are killed *in* ase see reply to "John."]

Cyclamens

hing to save seed from some speci- Cyclamens, and should be very cultural directions. How many each corm should be allowed to hould it be sown as soon as ripe? a cold greenhouse.

Miss F. Mordaunt.

huld confine the seed pods to five plant. Each pod produces quite a seeds. When set and swelling a thin stake to each stem carry- and tie securely, but not tightly, thereto. Continue to give water as required, but do not wet the pods. Continue to do this until the pods ripen, watching that they do not burst and spill the seeds. As soon as there is any sign of the pods opening gather them and lay out on paper in a sunny window, taking care that no draught carries them away. You need not, indeed should not, sow the seeds as soon as ripe, the Cyclamen being a plant whose seeds improve with age. That is to say, for a few years, but not indefinitely, of course. Seeds garnered this year would be in good condition for sowing in autumn, 1930, and a few subsequent years.]

TREES AND SHRUBS

Mistletoe not fruiting

I have enclosed a few twigs of Mistletoe from the garden here. Could you inform if same is female form? It has not set berries since I came here, but I believe it used to; but I am told there were many trees with Mistletoe on, but now there is only one left. If it is the female form when does it come into flower and would it be possible to fertilise with pollen from male form if that could be obtained at time of flowering? Scot.

Perthshire.

[All of the twigs sent bear female flowers. The plant you have is, therefore, berry-bearing, but you must see that the flowers are pollinated. The Mistletoe is now in full flower and a pollen-bearing branch should be tied on to your plant. It would be a good plan to graft the male form on to the host plant to ensure pollination in future years.]

Quick-growing creeper for south wall

(W. S. Clark, Dorset).—Clianthus magnificus or Abelia floribunda, the former for preference.

VEGETABLES

Preventing seed Potatoes from sprouting

(Nemo).—It is now too late to do much in the way of preventing seed tubers of Potatoes from sprouting. In future, in order to retard sprouting, the chosen tubers ought to be thoroughly exposed to the sun, at the time of lifting, until the skins are quite toughened and green. Afterwards store in an absolutely cool place from which frost can merely be excluded. A low temperature ("cold storage" in a modified form) is the surest preventive of premature growth. In spring lay the tubers out thinly in boxes, covering them with dry soil or with sand. If they show symptoms of sprouting turn the seeds, and this will keep them safe. As soon as it is possible to do so place the boxes out of doors, in a northerly exposure if possible. Your "succession," however, might be attained by planting—even at the same date—early, main crop, and late varieties. Potatoes do not all mature at the same time, even when the different sorts are planted simultaneously.

MISCELLANEOUS

Books on landscape and rock gardens

(R. A. B. O.).—Probably the best book with the most information in a simple way is "How to Lay Out a Garden," by Edward Kemp, which, although published in 1858, is still obtainable at second-hand book dealers at a very small cost. With reference to the rock and Alpine book, Farrer's "Rock Garden," a little book on rock gardens for amateurs, by H. H. Thomas, and "Rock Gardens, How to Make and Maintain Them," by Meredith, would all be of assistance. Spon's "Architectural and Builders' Pocket Price Book" will give you much practical information.

NAMES OF PLANTS

Constant Reader.—1, Probably Berberis Wilsonæ; 2, dried beyond recognition; 3, Spiræa arguta; 4, Juniperus rigida.

S. P. H., Tipperary.—1, Magnolia Campbellii, a typical bloom of this beautiful species. You are fortunate in having a tree in flower. It does not usually flower before it is about 25 years old. 2, Rhododendron arboreum, *not* R. barbatum.

CATALOGUE RECEIVED

W. E. Th. Ingwersen, Ltd., Sharpthorne, East Grinstead.—Hardy and Alpine Plants.

Lavender

Lavandula Spica, the common Lavender, is an evergreen shrub 3 feet to 4 feet high, with erect branches, the whole plant covered with a close minute down which gives it a grey or whitish aspect when the growths are quite young. The flowers are produced in July or August at the top of the erect stalks 12 inches to 18 inches long; they are arranged in whorls, crowded in dense spikes 1 inch to 2 inches long, and of a pale blue colour. The plant, though hailing from warmer climates, survives on all our warm soils, and may be cultivated almost anywhere, though it may be killed occasionally in severe winters on cold, wet soils. Propagation, however, is easily effected by cuttings placed in a cold frame in sandy soil during the autumn months, or plants may be raised from seed sown in the spring.

A native of the Mediterranean region, it has been cultivated in Britain since the middle of the sixteenth century, and probably long before. The flowers appear when few shrubs are in bloom, and their fragrance is appreciated everywhere. Mr. W. J. Bean, writing about this plant, mentions some dried flowering sprays gathered over thirty years ago which filled the room with their fragrance.

Formerly Lavandula vera does not appear to have been recognised as distinct from L. spica, and even to-day it is considered as a synonym of the latter species. De Candolle separated the two species in 1815, but for garden purposes they might be treated as synonyms. Lavandula vera is the plant commonly grown for yielding Lavender oil. This is the plant grown so largely in fields at Mitcham, Surrey. Lavender grown at Mitcham is a very ancient industry, the spikes being sold about London and elsewhere, and bought by house-wives for scenting bed-linen. They are also made into Lavender water. Lavandula spica yields the Oil of Spike. The leaves are also fragrant, but the scent is not so strong and pure as that of the flowers. There is a white-flowered variety, alba, and a dwarf form nana, both of which appear to belong to L. vera.

L. Grappenhall Variety

This is evidently a variety, or a good form of Lavandula spica. It is a variety of great merit, vigorous in growth, habit, and constitution, and a profuse and early bloomer, continuing until quite late in the season. The flowers are large, very fragrant, and produced on long spikes. It forms a fine shapely shrub when grown as a specimen plant, about 3 feet to 4 feet high. The foliage is grey.

The following is an extract from particulars supplied by Messrs. Clibrans, Ltd., Altrincham:

"You are quite right in your assumption that the plant was introduced to commerce by ourselves. We bought the stock from the late Mr. Thomas Fletcher, of Grappenhall, near Warrington, Lancs. Mr. Fletcher was in business in Warrington and resided at Grappenhall. He was very keenly interested in plants, and it was he who first brought this particular variety of Lavender to our notice in his garden.

"We do not know the parentage, neither at the moment are we able to state whether Mr. Fletcher had raised it himself, nor whether he had obtained it from some other source. In any case we were so impressed with its value that we purchased this stock from him in autumn, 1901, and put it into commerce shortly afterwards."

The Lavenders and many other plants of a shrubby and half-shrubby character, hailing from the Mediterranean region, that are hardy in Britain, like warm, sunny positions in our gardens. Many of these have greyish foliage, and are good winter plants, for example: Artemisia, Rosemary, Santolina, etc. They are seen to advantage planted on the top edge of walls, bottom, or face. Most plants having grey or greyish foliage seem at home when planted in conjunction or associated with wall-gardening, stone paving, or terrace gardens. The Lavenders are fine plants for dwarf hedges to borders, or as dividing hedges in the flower garden.

Dendrobiums

THOSE possessing a stove temperature may grow and flower the major part of these to perfection. They are easily cultivated among the general run of stove plants throughout their growing season from February and up to the time the pseudo-bulbs or annual growths have ceased growing, when a cooler as well as a drier atmosphere must be given them, so that their growth may become thoroughly ripened. Many are delightfully fragrant, while others have no scent. They are found thriving in pots, pans, baskets, also on blocks of wood suspended from the roof of the glasshouse, taking up but little space, and getting the necessary light for their well-being.

The resting period must be ample, say from October well into January, or even a bit longer. It is useless to expect a well-flowered plant that has not had this thorough ripening of the growths, which can easily be ascertained by examining the top of the current year's growth, although it is not here you will get many flowers this coming spring; it is the previous season's wood that produces flowers in plenty, notably D. nobile, and its varieties D. pendulum, intermedium, Wallishianum, cœrulescens, and, finally, wardianum, a most beautiful form, with large, individual flowers of a rich colour, and quite as easy of cultivation as D. nobile. Though this Orchid is termed deciduous, most of them usually retain part of their foliage, and at times produce a few flowers. It is the two-year-old growths that eventually become leafless, and yield the profusion of bloom on a thoroughly well-grown and well-ripened specimen. Where many fail is in being too eager to introduce them to stove heat again; this hurrying is fatal to a production of flowers. Watch and wait until you can see the "nodes" swelling up at the part where the leaf was. Sometimes nearly half their length will flower; some of their growths reach 2 feet or even more in length when well cultivated. A specimen of D. nobile has been known to carry as many as 300 flowers. D. wardianum is more or less of a pendulous habit, and may well be given basket treatment. It should also be stated that it produces its flowers freely on growths made the previous summer. D. crassinode, a good basket variety. D. devonianum, D. chrysanthum, D. Pierardii, and D. pulchellum also thrive and flower well thus treated.

As regards the resting period, an intermediate house that has more or less fresh air admitted according to outside conditions proves an ideal position providing the plants are kept quite near the glass, so that the ripening of the growths may be perfected and secure any sunshine that may be going. No moisture overhead should be given, and only sufficient root watering to prevent the same from unduly shrivelling. Pot-grown plants must be neatly staked, the individual growths being kept well apart, so that sun and air can do their part in building up stout, well-ripened pieces. When introducing the plants to more heat and moisture, see that they are given the coolest end, or else new shoots from the base will push, which are best retarded until the plants have passed their flowering stage, when every encouragement should be afforded them to perfect strong shoots to flower two years hence.

Should it be necessary to cut the flowers for indoor decoration, little harm will be done the plant if the growth is severed at the base; but this must not be overdone, or it will weaken the plant; and any growth that has ceased flowering and shows signs of shrivelling may be at once cut away.

There are a number of this genus, such as D. thyrsiflorum, superbiens, chrysotoxum, aureum, speciosum, and many others more or less beautiful, with various colouring, which require somewhat different treatment, and are best in a structure devoted to them; neither do they give the same amount of blossom as D. nobile when grown in an ordinary plant stove as above.

Pots varying from 5 inches up to 10 inches may be used, which must be perfectly clean, also the drainage; they should be quite half full, as they take a deal of root watering after once established, covering these with Sphagnum. The compost itself should contain more than half good fibrous peat, the remainder chopped Sphagnum, and a piece of charcoal here and there between the whole. This also does for baskets and for those cultivated on blocks of wood with Sphagnum, fastening the plant with copper wire, both of which naturally require far more water than those in pots. Dipping these in a pail or tank of warm water is the best remedy.

Division of the root-stock should be done just as new growth begins at the base, setting the plants on a cone-shaped mound a few inches above the rim of the pot or basket, keeping them well syringed twice daily. Any excess of root watering ere they become established would lead to dire results. All the genus enjoy the daily syringe during active growth, but discontinued during the resting period.

Like every other plant cultivated under glass, Dendrobiums have an enemy or two, mealy bug, scale, thrip, or yellow fly, which must be kept at bay by fumigating and sponging.

J. M.

Cistuses

All the Cistuses revel in full sunshine and are excellent subjects for planting on dry banks, and in poor, sandy soils, where many other shrubs would scarcely exist, they grow with remarkable freedom and flower profusely. Although the individual flowers last but a day, they follow each other in quick succession, and maintain a display over a considerable period. Natives of the Mediterranean region, they are, unfortunately, not perfectly hardy under all conditions in this country, but on light, warm soils in the southern counties one need have no hesitation in planting them freely. Plants can be easily raised from seed, which may be sown in a frame in early spring and grown on in small pots till large enough to be planted out. Propagation is also readily effected by means of cuttings. These should be made from partially ripened shoots in late summer, inserted in boxes of sandy soil, and
a cold frame, where they root

AWNS Require Attention—NOW

NOW is the time to feed your lawns in preparation for the summer months. A reliable complete fertilizer will quickly create dense turf. Moss, clover, and weeds should be eradicated now by applying Fisons' Lawn Sand.

Fisons' Technical Bureau is maintained for the benefit of enquirers, without obligation.

FISONS'
LAWN GUANO
(A Compound Fertilizer)

fest dressing for turf. It feeds the turf over a long period and will not burn olour the grass. Lawn Guano quickly strengthens the roots and encourages growth of fine grass. As used by important clubs and municipalities. Apply the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**5/-**	**9/-**	**15/-**	**25/-**

FISONS'
GRASS SEEDS

finest procurable, being specially tested before selection.

Mixture (for Bowling and Golf Greens, finest grasses only).

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**15/6**	**30/-**	**58/-**	**110/-**	**210/-**

FISONS'
LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and in so doing stimulating the grass. A thimbleful destroys a large weed, such as a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court. Measure and full instructions sent.

Prices, in Kegs :	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**5/-**	**9/-**	**16/-**	**27/6**

FISONS' POWDER
WORM KILLER

Is most effective against worms and is safer and cheaper than other preparations. It is convenient to use and a forced jet of water is unnecessary. Apply 4 ozs. to the sq. yd. or 1 cwt. to a regulation doubles tennis court. Full instructions sent.

Prices in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.

VIOLET CULTURE

For Pleasure and Profit

F. E. DILLISTONE, F.R.H.S. 2s. net

is the first book ever written on growing Violets for large scale production in this country and should be in the hands of all market gardeners and of all who wish to cultivate Violets whether as a hobby or for profit. This invaluable book is full of expert information on the whole subject from planting to marketing.

The contents include Soil and Drainage, Situation, Water Supply, Propagation and Selection, Planting, Hoeing and Feeding, Housing and Protection, Insect and Fungoid Diseases, Picking and Marketing, Costs and Profits.

Some Thoughts on Pruning Roses

literature of the Rose has now as- rd very bulky proportions. Every t of its culture has received con- attention in the Press, and no small this has been bestowed upon so that one wonders if there is any- sh to be written on the matter. sufficient egotism to presume that ows may mark a new epoch, the riter offers it as the result of ideas in the mind by a fairly long ex- of Rose-growing.

Rambler Roses Excelsa and Dorothy Perkins on arch and walls

gin at the commencement of the season, which, paradoxically, is at of that of the period, we ramblers to h first. No- ut a raw would think g the pruning until the ut so fearful the secateurs that when- are used they rally applied paringly. The nce is that the pergolas get with a lot of its that do but obstruct and disfigure . With such vigorous as Excelsa or Perkins mere are useless, nature of the suggests the it should re-

uts one in the words of and very ex- Rose grower expressing impatience with the of the average amateur on this Look at a Rose thoughtfully and it you where and how it needs was his sagacious remark. Never ds truer than these applied to such as those referred to above and milar. If they are such ultra- growers they tell us very plainly to rt a little, but plenty of space for the old wood is allowed to remain th will be all at the top, each oot seeking air and sunshine by self to ungainly heights. On an means the sides are bare of d flowers, and in any case it results in a lack of strong shoots from the base.

When the amateur starts pruning such Roses he seems to need the armour of the Christian for faith, hope, and courage. Then he is not afraid to cut out bodily at the base all old shoots so that new ones will appear early in the next season and replenish the growth. To leave this job until the spring means tearing off dozens of young shoots and eyes on wood that should be retained. This year being so exceptional after the record cold of late February and early March there may be still time to do the work now without much risk of this in some gardens, but it is autumn work properly when all wood that has borne its flowers should be removed.

A fearful pitfall to many amateurs is the pruning of standards—and, by the way, how they love them. Considering the trouble they prove to them one would wonder why the preference is shown for this form of Rose if there was no suspicion that they do not know what they are doing from start to finish. The light-hearted, airy way that the young starters plant out their borders or grass plots with standards is amusing to the old stager. Of course, they must be standards, because everybody else has them, and one must not be out of fashion in gardening any more than in anything else, so in they go by the dozen.

How they should be treated is often an unsealed secret to their owners. A neighbour tells them he prunes his hard. They see his fine blooms and imitate his example on such strong growers as Hugh Dickson or Caroline Testout, and lo and behold! some lovely, vigorous shoots come from the bottom. They prosper, but the heads of the plants do not, and, of course, are soon dead and done for. In support of such a statement this is exactly what happened in the garden of some young, newly married friends of the writer, who, when he saw the result of their innocence, was aghast. Not one of those standards had survived. Had saner counsels prevailed the heads would have been only lightly pruned, and any tendency to suckering instantly repressed. Had greater latitude been allowed to the top growth suckers may not have appeared at all.

In connection with pruning, one often wonders how much exhibitions of Roses have to answer for the failure of the amateur grower—at least, for the first year or two. Experience teaches, if it does not dishearten beforehand. The young enthusiast visits a show, sees marvellously fine blooms, reads that they are obtained by severe pruning, serves all his Roses the same, and meets with disaster, as in the case referred to above. When experience comes it teaches there is more in the raising of fine blooms than in merely severely pruning, and no form of Rose emphasises this so much as the standard.

What puzzles the old hand at Rose-growing is why the amateur does not turn his attention more to pillar Roses. Here is a way of beautifying a garden quite as attractive as any other, and offering fewer snares to the uninitiated. All the strong-growing sorts like La Tosca, General Jacqueminot, Florence Haswell Veitch, Juliet, or the two referred to before, and many others answer this purpose, besides the ordinary climbers. Here the matter of pruning is simplified for the beginner, for beyond the removal of old wood, the shortening back of the strong ones retained for a little distance from the ends, and the severer cutting of weaker shoots little more is needed, and vigorous growth need not be feared. And what a glorious show results the following season compared to the two or three blooms on the standard, which generally is all that the amateur can manage.

The best form of Rose for the young starter to exercise his powers on is undoubtedly the bush. Even here it cannot be asserted that his path is easy when it comes to pruning. Not only is it necessary to pay attention to the class of Rose, but also to the peculiar habits of at least certain individual plants. For instance, the Lyon Rose, at one time very popular and still a favourite, has a very strong objection to be pruned at all. Prune it in March or April and nearly every shoot cut will die down to several buds below. The writer's way is to humour it until well in May, and when growth is strong and vigorous to cut down where required, irrespective of new shoots. It does not sulk after that, but goes ahead. Several of the Pernettian variety have a similar habit.

The amateur who despairs of learning all these little peculiarities that may affect pruning may take comfort from what the present writer saw at a London Rose garden in a noted public park in pre-war days. Here every bush Rose was cut down to a uniform height as level as a table-top when each March came round. What was the idea of this method, considering that a good staff of capable gardeners were ever to hand cannot be said, but the results later on were certainly very satisfactory, and no mincing picking and choosing of cuttings from here or there could have produced better, for visitors from all parts of the metropolis used to come and enjoy the summer show, and testify to its excellence.

It has been truly said that nothing teaches an intelligent man more than the cultivation of a garden. It even tones down the dogmatism of the most egotistic—he remembers his own unaccountable failures—and that is saying much for its influence. So that to exalt any mode of pruning into a dogma is to fortify oneself against the reception of new ideas, and then it is time to quit gardening. Look well into the nature of the plant, study its habits, think how best it will yield the result desired, and then treat it accordingly. If there is any doubt in the matter err on the lenient side, if at all, and prune sparingly.

OLD SARBOT.

The Great Spring Rose Show

The National Rose Society's great spring Rose show is held this year in the Royal Horticultural Hall, Vincent Square, S.W., on Friday, April 19th.

This annual exhibition is, without doubt, the most extensive, beautiful, and varied display of spring Roses to be seen in any part of the world.

In the artistic classes the competition this year is very keen, and some very attractive exhibits are on view, to which reference will be made in our next issue.

Naming of Daffodils

A reference to the classified list of Daffodil names published by the Royal Horticultural Society shows that the raisers of new varieties have adopted various methods for selecting their names. Many raisers have named them after their wives and friends, as no less than 77 are registered with the prefix "Mrs." and 61 where the title commences with "Lady." An ideal way of naming flowers would, of course, be to select or create a name which would in some way give a pointer or guide to the parents, but that is not always easy, as frequently no proper record of the crosses is kept. Next to this, perhaps the best method is to find a name which gives some idea of the character of the flower. Many raisers have attempted this, as there are 111 names registered commencing with "gold" or "golden," 52 with "red," and 78 with "white."

The Rev. G. H. Engleheart, P. Barr, P. D. Williams, and The Brodie of Brodie appear to have exercised the most care in selecting their names. In addition to the titles they have chosen with a view to giving some guidance as to the nature of the flower, Mr. Williams has named many after the various places of interest near his home in Cornwall. The Brodie of Brodie has also, in addition to what might be called proper Daffodil titles, named many after places of interest in the Highlands of Scotland, where he resides, and others after places with which he was associated during his active service in the Great War at Gallipoli and elsewhere.

Owing to the very large number of names already registered it cannot now be easy for anyone to find suitable names for their new varieties.

Mr. A. F. Calvert, who has a very fine collection of new varieties, many of which have proved to be of sufficient value and beauty to justify their being registered, has taken several names from places he visited during his four journeys into the interior of Australia. Then, again, he has already named more than 50 of his new varieties after different racehorses he has owned. Bradwardine and Clwyd, both of which were much admired when shown last year, and received Awards of Merit, are named after horses which won several important races for him. Bradwardine won the Brighton Cup, Northumberland Plate, and Newmarket Handicap. With Clwyd Mr. Calvert won the Great Jubilee Stakes at Kempton Park, Bridegroom won the Queen's Prize at Kempton, and Royal Flush also won several races. Some of his other racehorses after which he has named Daffodils are Prince of Poets, Westralian, Bonny Winkfield, Chit Chat, Husky, and Liscarton. Another nice flower he has named after his steam yacht, "Iolanthe," 634 tons, which was originally built for Sir Donald Currie.

Classified list of Daffodil names, 1929

To Daffodil enthusiasts the R.H.S. classified list of names is indispensable. The new
list just out may be obtained from the
Horticultural Society, Vincent Square,
don, S.W. 1, price 1s. This comprehe
little book also contains the arranger
for the registration of Daffodil names.

Primula farinosa

REFERRING to F. H. Fisher's query regarding the longevity of Primula farinosa in Nature (page 229), although I agree with him that it is probably not a long-lived species, on the average, when growing wild, I see no reason why an individual plant under favourable circumstances should not live for 100 years or more. One reason for believing this is that I have a white-flowered plant that I collected in Upper Teesdale in 1920 that is still growing in the garden, where I planted it nearly nine years ago. Besides the Upper Teesdale plants I have had some for seven years from a habitat on the Lancashire coast, where, in contrast to the former, they would be accustomed to a comparatively mild winter and warm summer. In addition, I have collected this Primula on the Durham coast, in the French Alps, in Savoy and the Pyrenees, and in Italy in the Dolomites. The conclusion I have come to after cultivating it from so many different places is that it is not
so much the climate as the soil that ma
When I give it ordinary garden soil (a
loam that has been limed) it is short-
It does well for a time, but during the
or second winter its roots rot away, s
the crowns come loose with the frost, i
do not rot as well.

When planted in a neutral (not dec
acid) vegetable soil or in lime-free lo
have found it much longer-lived. I c
explain the reason for this, but suggest
in certain soils the bacteria, which app
attack the roots, are more virulent, an
plant is unable to stand their attack.
haps this supposed greater bacterial a
is brought about by the cultivation o
soil, and not by the presence of lime, a
vegetable soil and lime-free loam that I
used have always been from uncult
ground. This seems to me the more
as, when wild, P. farinosa appears to h
preference for a limy soil. If this is n
solution one would be driven to the idea
the greater water content of the soil in
of its wild habitats, or a colder winter

activity of all bacteria in others, are ors responsible for its well-being.

NORTHUMBRIA.

Sowing Streptocarpus

article on "Hybrid Streptocarpus," " F. H." (issue April 6th, page 239), nave grown this highly decorative use perennial with much success, and the cultivation submitted by your tor, except the covering of seed after ith fine soil. I find sowing on the and gently pressing the seed in gives num germination. Your contributor to mention the beautiful S. Wend- hich throws its blooms from a single height of 18 inches, and deserves a every collection. .F. C. G.

Tuberoses

your note on Tuberoses recently I ou may like to know that I found in the nursery gardens at Panama 1925 the original single form of e. It differs greatly in refinement ose we already grow in England, ronger throat, and the flower, which of the shape of a Jessamine, being and flatter. It is very fragrant, and bloom remained fresh in water for hree weeks. It has flowered well in a cool greenhouse for two seasons ported bulbs. Another difference is flowers form more of a cluster, some- the manner of a Bouvardia.

ALICE MARTINEAU.

Streptocarpus Wendlandi, which throws its blooms from the base of a single leaf

Disasters from frost

nting up the deaths and wounded I am agreeably surprised to find Buddleia alternifolia in rude health and covered with buds, though without any protection. It is good to find that this fine thing is quite hardy.

Solanum jasminoides is alive, though it has lost most of its leaves. Clematis Armandii has been cut to the ground, but is shooting up. The Californian Poppy (Dendromecon), which flowered last summer, seems lifeless and Feijoa with it, while none of the newer Rhododendrons have suffered, nor have two Camellias, one in angle of house the other in open, but sheltered by Bamboos.

The tale of disaster is worse when one comes to the Primulas. Wanda and Pam have entirely disappeared, so have the Bartley Strain of pulverulenta, and all the Alpicolas and the many hybrids, such as Red Hugh, damp and frost together not being to their liking, but P. frondosa is looking well. In fact, nearly all those that were planted out last September and October—hundreds and in many varieties—have vanished, leaving not a trace.

My Heaths have suffered a good deal—E. codonoides killed. Still, considering the severity of the frost and my especial black soil with water not far away, I am well content with the garden as a whole. The Meconopsis Baileyi and others and Gentian sino-ornatus are looking strong and well.

ALICE MARTINEAU.

Sunny Corner, Ascot.

The Streptocarpus is an attractive subject for the warm greenhouse

Nemesia Strumosa Suttoni and Polyanthus Spetchley strain

When Messrs. Sutton first offered Nemesia Strumosa Suttoni I procured a packet, and had a wonderful display, nor have I ever since had a failure with this glorious dwarf annual. And yet it is not a plant at all widely grown in many districts. When Messrs. Barr first put on the market the wonderful strain of Polyanthus raised by the late Mrs. Berkley, of Spetchley, instead of being disappointed at the produce of a small packet of seed I found that the seedsmen had really understated the beauty, size, and diversity of colour of this strain of this, our finest spring-flowering, plant. C. B.

Linlithgow.

Ranunculus Lyallii in New Zealand

I regret to gather from the notes of "A. W." on this subject in your issue of February 2nd last (which I read with very much interest, for they are the result of personal experience and observation) that the word "here" in my note published January 19th last conveyed the erroneous impression that this plant could be grown in Auckland. The wider meaning, "New Zealand," was intended. "A. W." is quite right in saying that the semi-tropical climate of Auckland is quite unsuitable, and I have not seen it growing outside the South Island of New Zealand.

There is (or was) a clump or two growing in the Rhododendron Dell in the Municipal Gardens at Dunedin (some 600 miles south of Auckland), and probably the Curator of those Gardens, Mr. J. T. Tannock, would also be able to furnish reliable information as to the growing and propagation of our so-called "Mountain Lily," though anyone following "A. W.'s" direction would, I think, be well guided.

When on the Milford Track one January (our summer) we first came on scattered clumps at the head of the Clinton Valley, and these, to our disappointment, had finished flowering and were ripening seed, but as we rose the McKinnon Pass the plants increased in number and size till just below the saddle there were colonies of them in full bloom, and their big saucer-shaped leaves holding more or less of a recent rain were used as drinking vessels.

On our return four or five days later they were covered by a pall of snow which fell in the interval. A. E. GRINDROD.

Auckland, New Zealand.

A spineless Cactus (Astrophytum myriostigma)

AMONG the quaint and curious things of Nature one can easily include the Cactus family as a whole, and as a real curiosity of plant life the A. myriostigma will be hard to beat. This plant, really a spineless Cactus, has the appearance and feel of a piece of stone, being quite hard and heavy, yet at the proper time it produces flowers of the Marguerite or large Daisy type, of a straw colour, and occasionally tipped with black. The plants themselves are usually globular, but generally have five ribs, the specimen illustrated being the four-rib or Bishop's Cap variety, which is much more uncommon. Sometimes they are discovered with six or eight ribs, but five is the usual. They are natives of Central Mexico, usually being found growing in the open Mesa amongst stones.

There are two distinct varieties, one being a grey or greyish-white, the other of a much greener colour. The former being located near Torreon, in "Orro de la Roso," the latter is abundant in the "Sierra la Tabla," near Guascama, or "Minas de San Rafael." Naturally, coming as they do from Mexico, they require a warm house. They are very easy to grow if the usual Cactus culture is followed, and are always objects of great interest.

A large specimen of the grey variety is very striking, looking like a piece of carved stone, and one has to look twice to be convinced that it is a plant. F. E. COOPER.

Shanklin, I.W.

Grafted Lilacs

Why will some nurserymen persist in sending out grafted plants of Lilac? One could understand the practice were the Lilac a difficult shrub to propagate, but why grafting should be applied to a shrub of which cuttings root almost as readily as those of a Fuchsia is not easily understood. Admittedly Lilac plants from cuttings require some time to grow into saleable plants, but, even so, when one has such plants there is no likelihood of sudden deaths under forcing conditions, or of outcrops of growth from the objectionable stock. It is practices such as this which bring the valuable art of grafting into disrepute. A SCOTTISH GARDENER.

Epilobium or Willow Herb

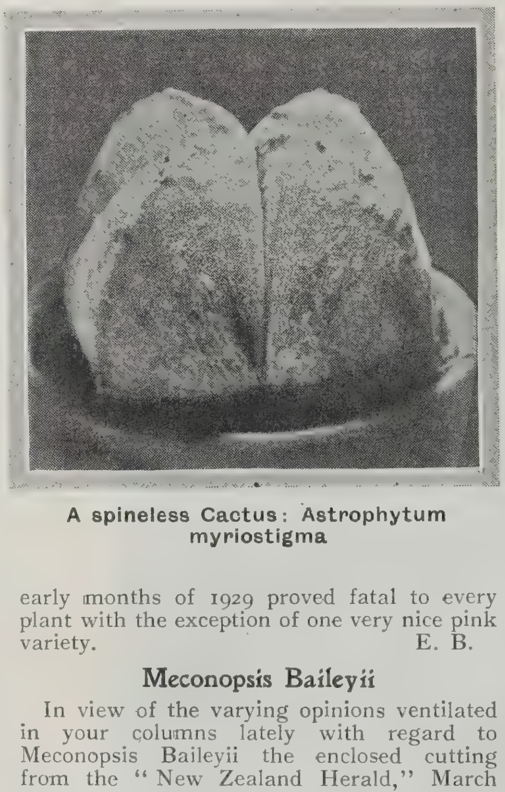
When in England in 1925 my wife and I were much taken by the Willow Herb (Epilobium angustifolium (?)) which, though grown in the parks, is regarded at home as a weed—albeit, a very pretty one. We thought we would like to grow it here, but though I have twice imported seed I have not, so far, succeeded in raising plants.

Perhaps one or other of your readers can inform me through your columns whether the seed loses vitality quickly or if it needs some special treatment. A. E. GRINDROD.

Auckland, New Zealand.

Antirrhinums: Wanted a hardier race

Would it be possible for raisers of this popular flower to direct their attention to giving us a hardier race. There is little lacking now in colour, in size of spike, and individual flowers, and in variation in height, but, unfortunately, they are very tender. In bygone days if one had a flower of good colour and substance it might remain in the border, and if trimmed over in the early spring would develop into a fine bush, but it is not so with the new race, which have no claim to be called perennials. Certainly the early months of 1929 proved fatal to every plant with the exception of one very nice pink variety. E. B.



A spineless Cactus: Astrophytum myriostigma

Meconopsis Baileyii

In view of the varying opinions ventilated in your columns lately with regard to Meconopsis Baileyii the enclosed cutting from the "New Zealand Herald," March 11th, 1929, may be of interest:—

RARE TIBETAN POPPY

Of interest to horticulturists is the flowering of a newly-introduced plant, the blue Poppy, in the gardens of Mr. F. C. Mappin, Epsom.

This rare species caused intense interest at the Royal Horticultural Society's show held at Chelsea, London, last May, a leading paper describing it as "the most beautiful flower on earth." It was originally found growing at an altitude of 11,000 feet by Major Bailey when journeying through Tibet, and again a year or two later in the same place by the noted plant collector, Captain Kingdon Ward, by whom it was introduced to cultivation.

In its natural habitat it is a perennial with attractive bluish-green leaves which, when young, are covered with white "hairs." The flower-stems grow to a height of 2 feet or 3 feet and bear several nodding flowers 2 inches or 3 inches across. There hav numerous attempts to raise the plant ir Zealand from seed, but so far none has completely successful. The plant now f ing at Epsom was successfully import its owner. A. E.

Auckland, N.Z.

Lupin in Spain

Can anyone tell me the name of the deep yellow Lupin with the fragran Cowslips that is now in bloom near th in Southern Spain?

I met it a week ago and fell in love it. Mr. "Iris" Baker and his b happened to be in the same hotel on way to explore the Atlas flora in Mo but could not help me.

I also found a beautiful Linaria flowers like black velvet and another and yellow.

All the hills were covered with the rynchium, which looks just like a very Iris unguicularis, and a charming pin grey Phlomis (to me), but which Mr. said was a Salvia. ALICE MARTIN

Broccoli for late districts

The Spring Broccoli is an esteemed coming at a time when fresh vegetabl by no means abundant. Speaking gen there is little use in attempting varieti mature during winter, as not one sea ten can a single decent head be secured. different with the varieties that matu March, April, and May, for, as a rule, survive the winter.

It is a mistake to sow these Broccolis too early. After repeated find that about the middle of April give results. To plant on too rich and to ground also invariably results in the dying off during winter. I have for years planted Broccoli on the site vaca Leeks or autumn-sown Onions and Sp and that without first digging the g It is somewhat difficult to plant in ground, but if the work is carried ou mediately after heavy rain it is easier. this treatment the plants, even if they slowly, are dwarf, sturdy, and firm.

In spring all dead foliage should moved, the ground lightly forked or hoed, and a mulch of well-rotted m applied all over the surface. This will g stimulate the plants, and when the Br are over, the manure can be dug in f benefit of the succeeding crop.

There are numerous varieties now market, but the following three I find reliable:—Evesham Giant, Leamington Methven's June. If one variety only be grown I would unhesitatingly "pl for the last-named. It is the hardiest good size, produces well-protected heads of excellent table quality, and g long succession. C. Bl

Preston House Gardens, Linlithgow.

Spring cultivation and sow

Excellent progress was made with c tion and sowing during the latter h March, when the land was found to excellent condition and easy to work good seed beds were obtained even on soils. So far germination of the spring ings has been slow owing to cold nigh lack of moisture. Good progress has made with the preparation of land for toes, and some earlies have been pl Although little of the main crop has be in yet, this work is about as forwa usual.

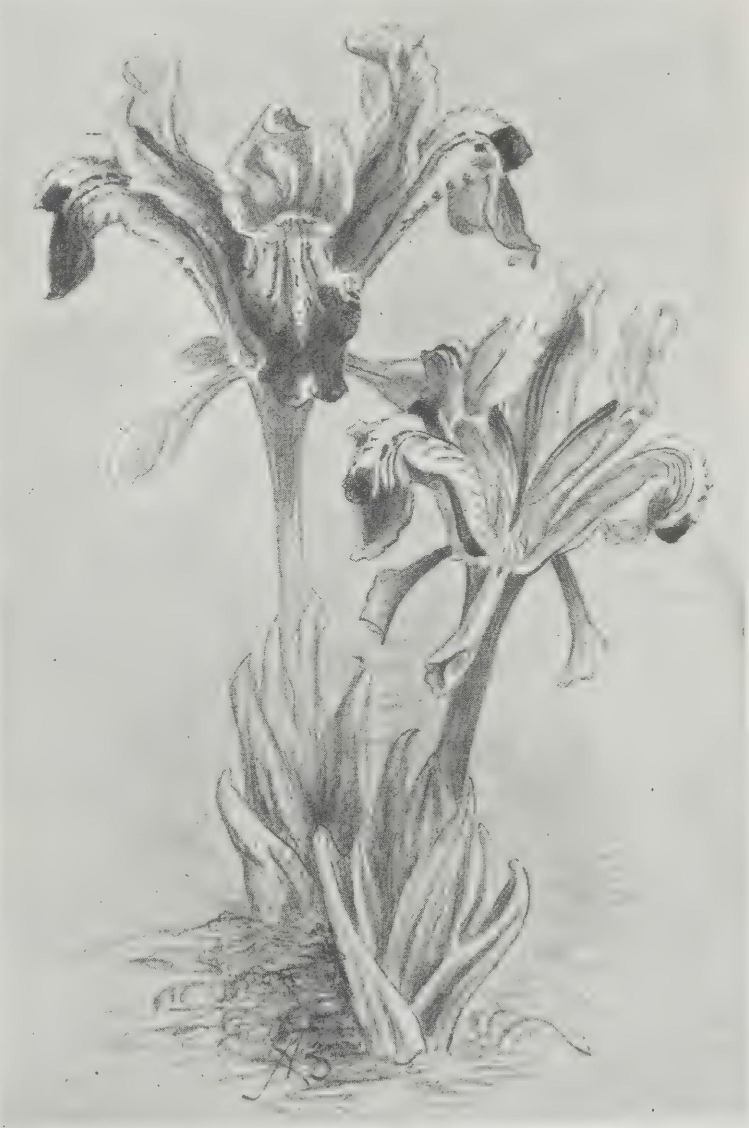
impossible to give a detailed descrip-
the colour ranges of this variable
, for as Sir Michael Foster wrote of
I were to adopt the practice common
' florists,' and give a separate name
plant which differed in any way in colour from its fellows, I could, I think, easily make a list of something like a hundred named varieties. In fact, hardly any two plants are exactly alike."

The best forms have a good deal of rich crimson colouring about them, especially on the upper surface of the style arm. In some a pure white tip to the fall makes a beautiful contrast with the purple velvet behind. The style crests vary in every shade of palest lavender, shot either with rose colour or the range of blues found in Hyacinths, and the sides of the crest wear tiger's stripes or leopard's spots, according to the taste of their owner.



From a drawing by E. A. Bowles

Iris rosenbachiana

The poor creature has suffered sadly at the hands of its portrait painters. The best figure I know is in Sir Michael Foster's paper on Bulbous Irises, published by the Royal Horticultural Society in 1893, although it shows a clumsily-built flower in a dejected mood, I should say drawn in its old age. The Botanical Magazine figure—T 7135—is coarsely drawn, and all the charming twists and rollings have been flattened out. H. Moon's beautiful group in "The Garden," June 16th, 1888, shows two flowers well coloured, but much confused in drawing. It was most likely drawn from a cut bloom, as it is shown too close to the ground and with wrongly shaped leaves, which are too few and as narrow as those of I. reticulata, instead of being wide and overlapping as in other Junos.

E. A. BOWLES.

The Balsam

Comparatively few people show any interest in the Balsam, one of the oldest of florists' flowers. Some who do grow it, do so in a half-hearted fashion, and seldom give the plants an opportunity of becoming all they might be. There is a reason for this, of course. It is not because of any difficulty in regard to their culture, nor that the flowers of the Balsam are not beautiful, it is that they are "unfit for cutting."

We live in a time when the worth of a blossom is not only measured by its beauty and sweetness, but by its value for cutting. This is a barrier so far as this greenhouse annual is concerned. I use the word "greenhouse" advisedly, as, although I have grown it as a summer bedder, it is really when grown in pots, anything up to 10 inches, with good, rich food in the shape of old loam, leaf-mould, and cow dung, and with stimulants administered from time to time, that one is likely to obtain worthy specimens.

LEAHURST.

REMINDERS FOR THE WEEK

Southern and Midland

Pruning shrubs

Those grown in masses for their coloured bark are so beautiful and in such striking contrast to ordinary dull-wooded trees and shrubs growing about them that we are tempted to leave them unpruned until as late in the season as possible. The time, however, has now arrived when this must no longer be delayed, and I advise those who would enjoy the richest effects to prune such shrubs back rather severely, *i.e.,* to about three or four buds from their base. These remarks apply to the glorious Red Dogwood (Cornus alba), generally—though erroneously—entered in nurserymen's lists as Cornus sanguinea, this latter a native and less important shrub; also Salix vitellina var. britzensis, a lovely subject for a wet piece of ground, the white-barked Brambles, Rubus biflorus, R. quinqueflorus, and R. leucodermis, with bluish stems, and other subjects.

Bamboos and Hollies

The present is an excellent time for the lifting and transplanting of these fine subjects, which are just commencing their new growth. If moved with care, mulched with litter, and kept moist at their roots, with an occasional spraying overhead should the weather prove hot and dry, no anxiety need be felt for their future. Should the planting include Hollies of large size, a good, stout stake should be added to prevent swaying.

Seeds of early flowering bulbs

Unless these are required to ripen for future sowing it is much better to remove them and thus enable the plants to develop better bulbs instead of wasting energy on unwanted seeds. The charming Chionodoxas, Scillas, Iris, Snowdrops, the large-flowered varieties, Erythroniums, Anemones, and Daffodils are included here.

Removing protective material

Ashes piled around choice Delphiniums, Gypsophilas, and other succulent plants to protect their young growths from slugs, and similar material used for the protection of doubtfully hardy shrubs, etc., must be removed without delay, as exposure is essential for the robust growth now developing. The same applies to climbing plants on walls, arbours, etc. Many choice wall shrubs have been severely damaged this year, and the sooner the affected growths are shortened back the better it will be for them.

Bedding plants

These must be hardened off in succession, and for this purpose cold frames are excellent. Pelargoniums, Fuchsias, Heliotropes, and a whole host of subjects used for this purpose will be perfectly happy in cold frames from this date, and safe if mats are thrown over the lights at night. This will relieve the congested conditions of the houses and enable later-struck batches of plants to develop more freely. Pinch out the tips of growths showing a tendency to run away, and thus preserve shapely plants.

Peas

A sowing should be made every 10 days in order to maintain a constant supply, and those which are now growing freely should be staked before they exceed 6 inches in height, otherwise squatting will take place. Excellent varieties are Gradus, Gladstone Improved, Royal Salute, and Telegraph.

Kidney Beans

A sowing of these may be made in a cold frame at this date, the lights being kept closed until the Beans are through the soil, when on fine days air may be admitted. The lights, however, should be closed early in the afternoon and the plants lightly dewed over in order that the enclosed sun-heat may carry them through the night.

Potato planting

This should be completed at the earliest opportunity, and the early varieties which were started in frames and planted on warm borders should have a little soil drawn up around them immediately they push through the soil. Keep the root store as cold as possible, even if this entails a damping of the floor occasionally, otherwise those preserved there for kitchen use will wilt and lose their value. This applies to all kinds of stored roots.

Mulching fruit trees

From this date a good mulch applied to heavy-cropping trees of Peach, Plum, Apricot, Figs, and Pears growing on hot, sunny walls will be found most beneficial. The borders should, however, be in a moist condition before its application.

E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Tomatoes

If not yet done, it is now advisable to get the main batch of these into their fruiting quarters. With care these may now be planted, even in unheated glasshouses, but in this case all possible sun-heat must be conserved by closing the house earlier than when artificial heat is used. Very careful watering is also necessary, for while the Tomato resents actual dryness at the roots, a too frequent application of water before the roots have taken full possession of the soil is certain to bring disaster by "souring."

Salsify and Scorzonera

A sowing made now will, ordinarily, supply all demands for these roots. The ground should be double-dug, a fair dressing of manure being given the bottom spit, but none in the top, or the roots will fork and be of no use. Shallow drills 15 inches apart should be drawn and the seeds scattered thinly and evenly. When large enough to handle, thin to 9 inches apart in the rows.

Parsley for early use

The plants raised under glass should now be ready for planting out after being well hardened off. Allow 9 inches to 12 inches between the plants and, where possible, have the row near a path or alley so that supplies can be picked easily in all weathers.

Onions

Box-raised plants, providing the weather is fairly genial, should now be planted out on richly prepared but firm ground, taking care to have the bases of the plants very little below the surface, for if planted deeply only "thick-necks" will be had.

Lettuce and Radish

To ensure regular supplies of these a sowing should be made every fortnight or so. Rich, rather cool soil is desirable for best quality. If sown on dry, thin ground the flavour of both will be poor.

The Celery trenches

These should be prepared now, as the soil is still fairly moist, and it will be possible to make neat and workmanlike trenches without much difficulty. Do not spare
manure, as good Celery can only be gr
in very rich soil.

Potatoes

The planting of these may be finishe
once, even the latest varieties being none
early if planted now.

The Strawberry beds

Well hoe the soil between the rows
quently, and give an occasional dusting of
wood-ashes, which, besides being benef
to the plants, is also very discouragin
slugs. Remove runners as they appear,
also flower-trusses on newly planted beds

Currants and Gooseberries

Plying the Dutch hoe frequently bet
the bushes will keep down weeds and,
dentally, benefit the bushes.

Bedding plants

Continue to move these to cold fram
they become large enough. There are
several varieties to be pricked off, and
will require the space vacated by earlier
hardier subjects.

Pansies and Violas

The planting out of these popular sub
should be proceeded with as fast as poss
it being advisable to give the roots a ch
to take possession of the soil before the
warm weather sets in.

Border Carnations

These should also be planted in
flowering quarters. A fair dressing o
wood-ashes forked into the surface b
planting begins will greatly help the p
to take a grip of the soil.

Border Chrysanthemums

These must now be carefully harden
and planted in their permanent qua
Only moderately rich ground shoul
chosen for these plants, very rich soil
leading to soft, rank growth and few
badly coloured flowers.

Sow hardy annuals

By sowing the seeds of these homel
beautiful plants now, germination w
quite rapid, and slugs and other vermi
have but little chance to attack the seed
as they so often do when the seeds ar
in too early. Sow thinly, and also thi
young plants vigorously as soon as the
large enough to handle. Few of these
require rich soil, some of them indeed
doing really well on poor ground.

Plant out Sweet Peas

If the weather be fairly genial the pl
of these should be carried out now.
must, of course, be properly hardened
fore this is carried out, so as to be a
stand any change of climatic condition
may follow.

Late flowering Chrysanthemums

The bulk of these are now fit for
into 6-inch pots. Use a good, subs
compost and pot firmly. Return t
frames and keep rather close and shad
a few days, but afterwards allowing
dance of air and all light possible.

Young Gloxinias

Seedlings from a January sowing ar
advanced enough to be potted off into

ly, we imported from Central America
egg stage. The nymphs of this grass-
proved to be very destructive to the
ent green tips of such Orchids as the
Phalanopsis and the Dendrobiums, destroying many of these, and, of course, curtailing our display of flowers. The other pest we had to contend against was the Australian cockroach, which seemed to have a fancy for the same succulent points. Both of these creatures had the nocturnal habit, and the destruction they created was always carried out at night. By dint of fumigating and hunting these pests we have now apparently got rid of them.

LOUDON MACQUEEN DOUGLAS.
Newpark, Mid Calder,
Midlothian, Scotland.

Chrysanthemums

These are now growing apace and must be encouraged to develop strong growth by airing freely on all favourable occasions. A cold frame is the most suitable place for them at this date, and the plants should be placed on a bed of moist ashes. Shift the little and later struck plants into larger pots as required, but not exceeding 6 inches in diameter at present. Where decorative plants to flower in 6-inch pots are required a batch of cuttings should now be taken. These will strike freely if placed in a cold frame and shaded from bright sunshine.

Daphne in full bloom at Newpark

The Rose Garden

THE first two weeks of April are usually set apart to commence the pruning and thinning of Rose trees and bushes, yet no exact date is advisable, as the weather, also local conditions, should be the determining factor ere the knife is brought into use. The pruning is a very important business because different varieties require a mode of cutting it would be folly to mete out to the whole family of Roses if the very best results are to be looked for when flowering time arrives. Further, the more hardy varieties, such as Hybrid Perpetuals and Hybrid Teas, should be the first to start on. The Teas themselves are usually of weaker growth, the last to be dealt with. Unless the secateurs are exceptionally sharp the knife is still the best instrument for pruning, first removing any dead wood or briar shoots at the base, if any, although the latter can be more easily detected when in leaf. Twist these in preference to using the knife for their removal, and in case of any overcrowding of Rose shoots remove the worst or ill-placed. Rose bushes are frequently left far too thickly to get the best blooms procurable.

An interesting collection of Lent Roses or spring-flowering Hellebores, sent by Mr. Scrase Dickins, Coolhurst, Horsham, to the R.H.S. Meeting on April 9th and 10th

As regards Hybrid Perpetuals some good growers of half-a-century ago used to cut back to two buds, yet while not quite advocating this close pruning, these as well as the Hybrid Teas will certainly respond to more severe shortening than the Teas for instance, although the latter should be well cut back as regards the weaker shoots, leaving the strongest 6 inches to 8 inches long, cutting quite close to a bud in each instance. The third or fourth bud from the base of last year's wood will be suitable for H.P. as well as H.T. The stronger the wood the less necessity to hard prune. Newly planted trees or bushes need cutting hard back as soon as it is seen that the buds are swelling up.

China Roses require a good deal of thinning out, but the best results are obtained when not hard pruned, then you get fine bushes 4 feet to 6 feet high and half as much through, creating a wonderful sight when at their best about the middle of summer. Roses occupying wall space, pergolas, etc., should have been attended to immediately they passed out of flower, thus throwing more sap into the new basal shoots as well as giving more space, sunlight, and air, which aids progress of the same and the maturation of the new wood for the following season. Some of these shoots usually require a little shortening in the spring, cutting to a prominent bud.

Where Bracken or strawy litter has
afforded the weaker Roses as a prote

Con- to water, and feed occasionally with -manure until they have completed growth, and when the leaves show of decay gradually reduce the watering ey may be finally transferred to their winter quarters. Propagation by seed proves a ready and very interesting method of increasing the stock of plants if one has the necessary space at command. The seed should be sown in the usual way, using a seed-pan and covered to the depth of about ¼ inch. Use a rather light compost for this operation—two parts loam, one part leaf-mould, and a good dash of sand.

If the seed is new, germination will take place in a few weeks, when they might, with advantage, be placed near the roof-glass and kept shaded from bright sunshine, using the syringe on all favourable occasions. The little seedlings will soon make sturdy growth, and when they have begun to make the third leaf they should be potted singly into thumb pots, using the same compost as before. I find it better to plunge the little pots in finely sifted ashes in a box which retains moisture and keeps the surroundings more uniform. Here, if they are well tended, they will make such progress that the little plants will soon require to be potted on into pots a little larger. In the early stages it cannot be too often repeated that the pots must be well drained. Seedlings respond freely to liberal treatment. Some cultivators rest the seedlings during the winter, but I think it best to keep them growing continuously until they flower, which generally takes about two years from sowing the seed.

It is very seldom they are troubled with insect pests. The worst enemy is Thrip, generally brought about by too dry an atmosphere or too close proximity to the hot-water pipes. A good method to combat this evil is to spray occasionally with an approved insecticide.

Once a good batch of these plants is secured they will continue to flower annually for many years.

Tropæolum tuberosum

The tuberous Nasturtium is more generally known as a decorative plant in this country, but it is also worth the attention of growers as a vegetable, for it has many of the properties of the Potato. Known as the Capucine tubéreuse in France and the Peruanische Knollen-Kresse in Germany, it is in more general use on the Continent than in this country, though it makes a useful winter dish where a large variety of vegetables is in demand.

A native of South America, where it grows in mountainous areas at altitudes of from 5,000 feet to 10,000 feet, it is a heavy yielder. In nutritive qualities it is equal to the Potato, and, although the tuber has a suspicion of woody tissue, this disappears in cooking.

Cultivation is similar to that of the Potato, and the tubers should be planted in rows about 3 feet apart in April or May after danger from frost is over. The long, trailing growths may be allowed to run over the ground, but better results are obtained if light branches are provided for them to grow over. Growth is much slower than that of the Potato, however, and the tubers do not form until late in the autumn. They should, therefore, be left to grow until October or November, when they may be lifted and stored in sand.

W. AUTON.

Iris stylosa

This and its lovely varieties, large plants which have finished blooming, should now be lifted, divided up and replanted at the foot of warm, sunny walls. This is necessary for the protection of the very early blooms more than anything else, as the plant will thrive in a reasonably sheltered position in the open. The soil should be fairly good, and water given occasionally until the plants are established. The old foliage may be shortened back.

SHRUBS OF RECENT INTRODUCTION

By Herman Spooner

During the last half century a great change has taken place in gardening as practised in this country. Perhaps the greatest change of all is in the taste that has been developed for hardy plants, particularly for hardy flowering trees and shrubs. Although a number of very fine species were available before the period mentioned, they were, for the most part, lost in the dismal plantations that were known as shrubberies, whose main purpose was to give privacy or shelter, and not primarily to display the beauty of the trees and shrubs that composed them.

TOWARDS the end of the 19th and the beginning of the 20th century this taste was fostered by the numerous introductions of new species, including many hardy flowering trees and shrubs, which took place about that time. These new species came chiefly from Japan and China, and were due, for the most part, to the activities of such collectors as Maries in Japan, and Wilson, Forrest, Farrer, and Ward in China. The result is that the number of beautiful trees and shrubs available for gardens is now so great that the amateur is bewildered when trying to make a suitable selection from catalogues, especially if he is dealing with a garden of only a limited extent. It is with a view to pointing out which shrubs seem to have "come to stay," amongst the introductions of the last 50 years or so, that the following notes are given.

Corylopsis Veitchiana, a spreading Hazel-like bush

One of the earliest spring-flowering shrubs, producing pendant spikes of primrose-yellow flowers in March and April

To commence with the earliest of spring-flowering shrubs, the Witch Hazels, the most important addition was made just about 50 years ago, when Maries introduced to Messrs. Veitch's nursery the fine species, Mollis, from China. This has the largest and most richly coloured flowers of any of the half-dozen or so species known in cultivation, and if space for only one can be spared mollis should be selected. When planting, it should be remembered that its flowers are produced in winter, and a sheltered spot should be chosen for it and a fairly light, warm soil.

Belonging to the same family as the Witch Hazels are the Corylopses, small shrubs with pendant racemes of primrose-yellow flowers, that appear in early spring before the leaves are put forth. The Japanese species, pauciflora and spicata, are the best known, as they have been longest in gardens, but recently several others from China have been introduced, to which the names Willmottiæ, Wilsoni, and Veitchiana have been given. Speaking broadly, these have a general resemblance to each other, and, where space is limited, only one species need be grown. A warm situation or a sheltered spot in the foreground of the shrub garden should be chosen for them.

To the extensive Viburnum family several important additions have been made of recent years. The most meritorious of these is Viburnum Carlesii, a native of the maritime areas of Korea and islands in the Japan Sea, whence it was introduced about 25 years ago. It is a deciduous shrub, produci globular clusters of fragrant pearly- flowers in April and May. These are at the ends of the branchlets of the pre year, and for this reason the shrub s not be pruned. It is of rather slow gr but succeeds in most soils if not to where the situation is open to the sun Even in small gardens this choice s should have a favoured spot.

A closely allied species, now known bitchinense, was formerly in culti under the name of Carlesii, but it is a straggling and in every way a less de plant than the true species.

A choice Viburnum from China, whi owe to Farrer, is V. fragrans. This, li preceding, is deciduous, and has the of producing its fragrant flowers durir winter months. These are borne in cl that are pink in the bud stage, but white when fully open. They are fol by fruits at first of a red colour, then It should receive the same treatme Carlesii, and succeeds in similar situat

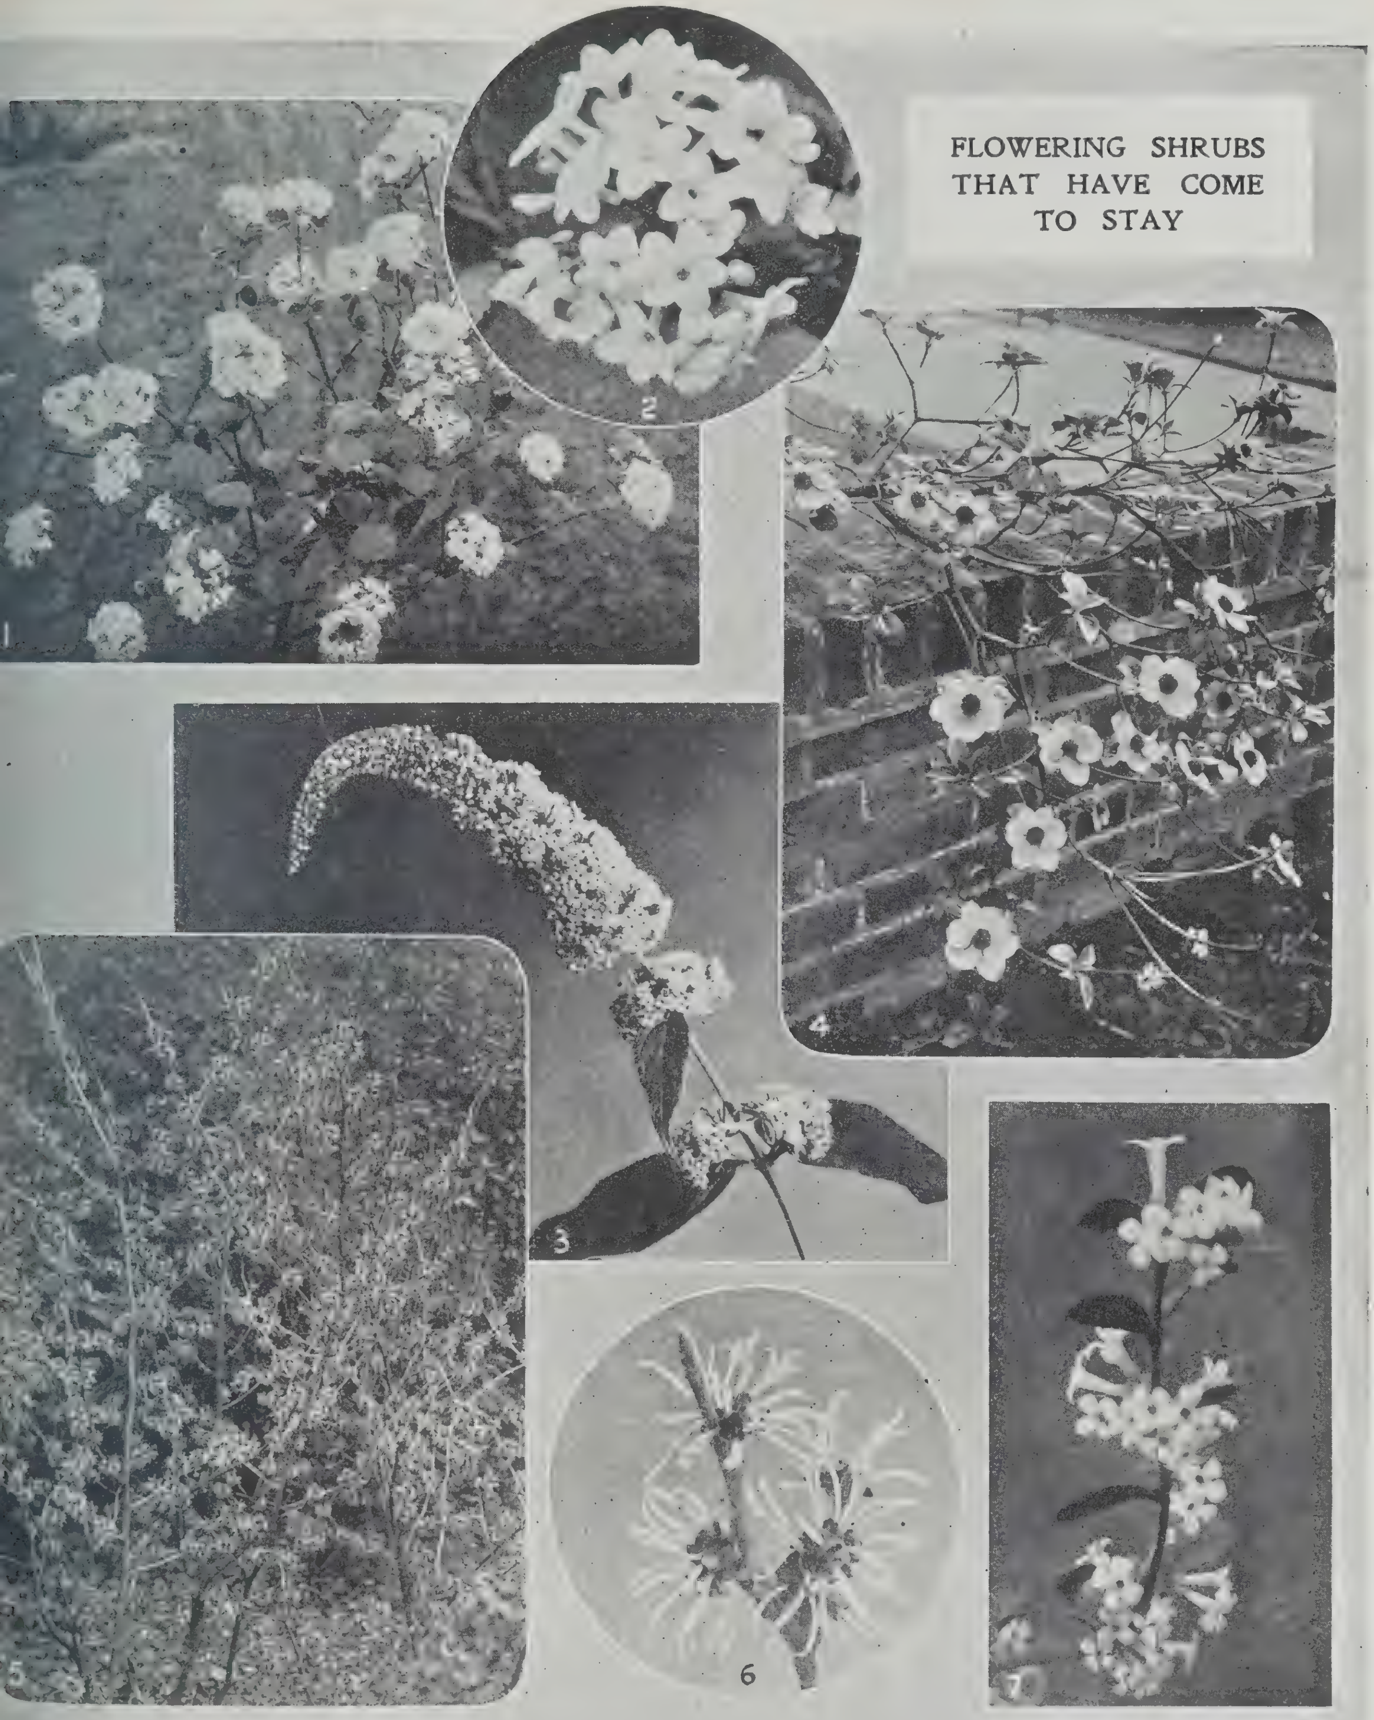
Of the evergreen species V. rhytidoph is, perhaps, the most remarkable, it the largest-leaved of any. The leave thick and corrugated, with a heavy beneath. The flowers are not very tive, they are borne in large corymbs a succeeded by red fruits which ultimate come black. Where space can be af it is a desirable species, but for smal dens the more elegant V. utile, with flowers and blue-black fruits, or V. D with its broad, oval, leathery leave turquoise-blue berries, will probably b ferred.

All the above belong to the fertile-flo section of the genus and are quite d from the sterile-flowered kinds tha known as "Guelder Roses" and " ball Trees," many of which are well and deservedly popular in the shrub ga

The magnificent genus, Magnolia, h ceived many important additions durir period we are dealing with, although n finer than the older M. stellata and M spicua and its hybrids, that flower ea the year before the leaves appear.

Perhaps the best of the newer additi M. parviflora, a native of Korea a Japan, whence it was introduced som ago, but is still uncommon in gardens. species produces its flowers in May an after the leaves are formed. The 4 inches to 5 inches across, egg-sha bud, and saucer-shaped when expanded infolded petals of pure ivory-white, central mass of scarlet stamens which the most remarkable feature of thi flower. Magnolia Wilsonii, introduce China in 1904 and again in 1906, clos sembles this species, and is at prese rare. Also closely alien to parviflora Watsonii, which was introduced from in 1889. The exact home of this plant known, and it has been suggested t may be of hybrid origin, the supposed p being M. parviflora and M. hypoleuc it is less hardy than these species. I duces larger flowers than parviflora, bu it, has blood-red stamens and a strong odour. For small gardens these fine s are welcome additions as they are not

FLOWERING SHRUBS THAT HAVE COME TO STAY



nd 2. Viburnum Carlesii, the most popular shrub of recent luction. Native of Korea. Flowers blush pink, passing to pure , and very fragrant.

Buddleia variabilis magnifica. The large inflorescence of fragrant purple flowers have a great attraction for butterflies in late summer.

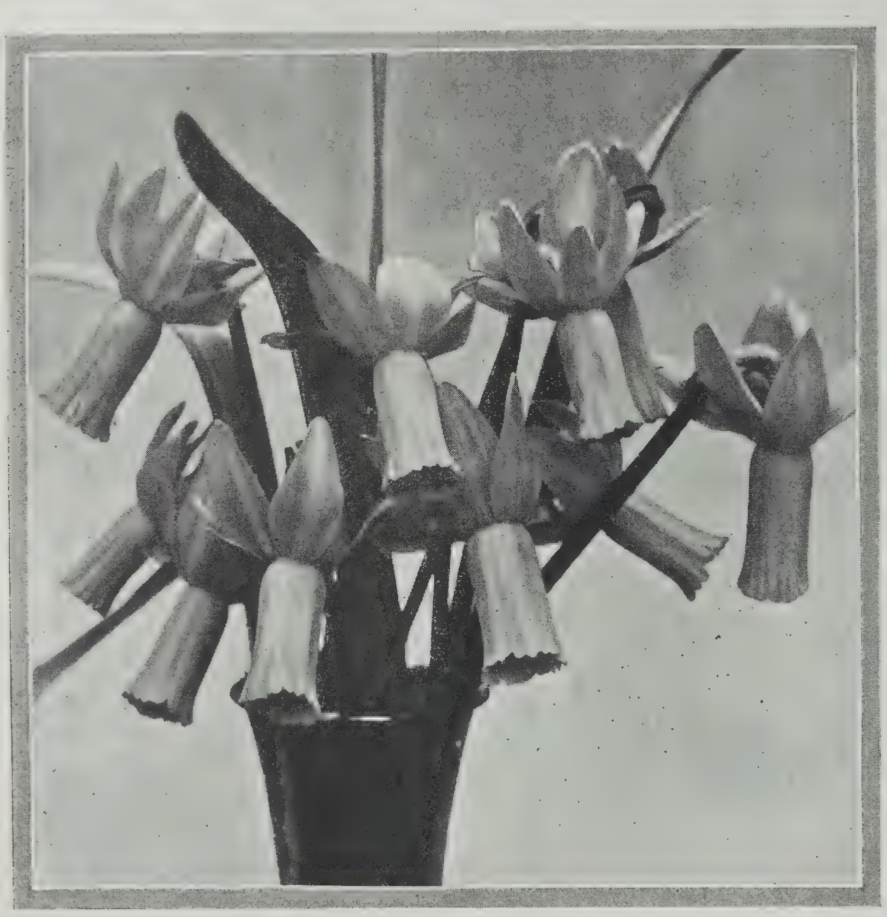
4. Cornus Nuttallii, the noblest of the Cornels or Dogwoods from Western N. America. The large petal-like bracts are cream coloured.

5 and 6. Hamamelis mollis. Golden-yellow flowers of rich fragrance in mid-winter. The finest of the Witch Hazels.

7. Osmanthus Delavayi, one of China's gems. April flowering.

to quickly outgrow their space, although in their native countries they form small trees.

Before the introduction of new kinds from China the S. American Buddleia globosa, the "Gold Ball Tree," was the only hardy representative of the genus in this country. Since the opening up of China by collectors many additional species and varieties have been disclosed, some of which are valuable acquisitions. The most important are the forms of B. variabilis, known as magnifica and veitchiana, which produce long terminal racemes of rich lavender-purple or mauve flowers, small as individuals, but showy in the mass. They have a honey-like fragrance and in July and August, when they appear, they are a favourite haunt of butterflies. To produce the long shoots which terminate in flowers the plants should be pruned hard back in winter or spring. These shrubs are already popular and are found to be valuable as town plants and for seaside gardens. Both these forms are introductions by Wilson.



A new Cyclamineus hybrid (unnamed), with trumpet 1½ inches long
Shown by Mr. F. A. Secrett

A quite distinct species which we owe to Farrer is B. alternifolia. This is also from China, whence it was introduced about 1914. This species produces its flowers in clusters in the axils of the leaves, along the entire length of the slender arching branches. They are lilac in colour, fragrant, and appear in late spring and early summer. Planted on banks or beside a lake this fine species is a most effective ornament.

The useful genus Osmanthus, usually represented in gardens by the Holly-leaved O. ilicifolius, has received several important additions from China during recent years. One of the most delightful of these is O. fragrans, a neat little shrub only a few feet in height, clothed with small Box-like leaves in the axils of which are borne the flowers. These are produced in spring in clusters. They are small and tubular, resembling those of a Jessamine in miniature, and are delicately scented. Another and hardier species is O. Delavayi, also a small shrub with terminal and axillary clusters of white, fragrant flowers that appear in April.

Few gardens are so favourably situated that the fine varieties of Camellia japonica can be grown in them without the protection of glass, as their delicate flowers are liable to frost injury. The family, has, however, a hardy representative in C. cuspidata, a recent introduction from China. This is a neat evergreen shrub with bright, glossy, green leaves 2 inches to 3½ inches long and small white flowers produced in April that resemble in miniature those of the single, white-flowered Camellias. The moderate size and neat appearance of this shrub commend it to the attention of gardeners, although its flowers fall far short of the perfection of the indoor kinds.

Related to the Camellias are the Stewartias, several of which are in cultivation, although rare. The Japanese species, S. pseudo-camellia, is one of the hardiest. It produces white flowers in July and August. These are cup-shaped, with crisped margins and a central mass of orange-yellow stamens. Before they fall in the autumn the leaves assume beautiful tints of red and gold. A sheltered position, but not a dry soil, should be chosen for it, preferably in a peaty mixture.

(To be continued.)

Salvia patens

A few pots of this lovely blue flower are appreciated in greenhouse or conservatory, so a few strong young plants should now be placed in 5-inch pots which, when well filled with roots, can be moved to the 8-inch size and thus form fine, large specimens.

The Strawberry

THE culture of this plant is compara
easy, and it will grow in any good
den soil. The soil should be
trenched 2 feet deep, adding good
manure to the depth of 1 foot from th
face. In trenching, if there should be
soil it is advisable to throw it to the
as to mix in with the manure and pr
the plants making too much leaf inste
flower-stems. Planting should be carri
as soon as the young plants grown
runners are sufficiently rooted, whil
ground is warm enough to encourage g
before winter. If this is not convenie
operation should be held over until
spring. Choose a dull day for planting,
the soil is moderately moist. The prop
tance for planting varies according
variety and nature of soil. Good, ric
and robust-growing plants, such as
Sovereign, require 2½ feet each way; s
varieties only require 2 feet between the
and 18 inches from plant to plant.

A trowel should be used for pla
taking out sufficient soil to enable the
the plant to be covered, and then p
firm with the hands. On no account
the crown of the plant be buried. Afte
has been done give a dressing of old de
leaves if the ground has a tendency
heavy, and water well in, after
sparingly until the plants are well root

On completion of planting the g
should be kept clear of weeds, using th
occasionally to stir the surface. If ru
appear do not cut them off, otherwise a
abundance of foliage is induced. Wai
the runner has a second joint, when
be removed up close to the parent plan
a sharp knife. As the plants develo
show their flower-spike, surface-dress t
close up to the plants with clean slaked
after which a good mulching betwee
rows is very advantageous. This
should consist of dry stable litter well s
out and freed from all horse-droppings

During the flowering period until the
are ripe, the plants should never be a
to become dry, for they evaporate a
amount of moisture during dry we
Copious supplies of water should be gi
as to reach the bottom roots. As the
ripen withhold the water to ensure
flavour.

After the fruits are all gathered r
the litter and clear the bed of weeds a
cayed leaves, after which it should be
dug over to allow air and moisture
to the roots.

If this method be adopted the plan
give good results for at least four
years, after which new beds shou
planted.
J

"Stewing" Pears

Nowadays it is, more or less, the f
to decry stewing Pears and to say tha
ought to be replaced by dessert va
which (so the critics say) are better fo
ing or cooking purposes and, besides,
preciated in a raw state. These criti
entirely wrong, for a dessert Pear is pa
flavourless when stewed, and is not ne
juicy and tender as the varieties gro
cooking purposes. Such sorts as C
Verulam, and Uvedalis St. Germain
cellent for stewing, and during Janua
February the supply is hard put to it t
pace with the demand. These ar
hardy Pears and bear consistently.

w Daffodils, exhibited for the first time on April 9th, raised by The Brodie of Brodie, and shown by Mr. R. F. Calvert

w Daffodils in Greycoat Street

Royal Horticultural Society's new in Greycoat Street was well filled a good variety of exhibits on April 10th, when those who are able to early Daffodils put up a grand dis-

L. Richardson, of Waterford, was in his very best form, and was the much-coveted Gold Medal. His contained perfect blooms of such arieties as Golden Flag, Master Nimrod, Solario, Beersheba, Music elen O'Hara, Tenedos, White Nile, hite Emperor, Marquis of Headfort, Glow, Loyalist, Mystic, Silver Plane, Fortune, Brightling, Fanny Currey, , Scarlet Gem (an attractive Poetaz), , and Golden Ingot. Every vase in ction was an object of interest, and should be made of the great care and n in the arrangement of this magni- llection. The two novelties, Fanny an exquisite Leedsii with a rich illed cup flushed with apricot, and ngot, a large-flowered Incomp. with en-yellow trumpet, both received an f Merit.

ollection of Poets by Mr. F. A. vas one of the great attractions of v. Foremost among the varieties ere Red Rim, Wide Wing, Dinton nnie Weedon, Huon (one of Engle- est), and Everlasting, a new Leedsii. group was one of the finest Cycla- hybrids we have seen, having large, deep, lemon-yellow flowers with trumpets 1½ inches long (see illustration).

From Barr and Sons came a magnificent and well-staged group containing bold vases of Glory of Haarlem, Hera, Fiery Monarch, John Evelyn, Nero, Polemon, Beersheba, imposing pillars of Sunrise, and several double-flowered varieties, including Glowing Phœnix, Milk and Honey, and Carnation.

Messrs. R. H. Bath, Ltd., showed a deep golden trumpet Daffodil named Advance Guard, suitable for market and garden purposes, and this was recommended for trial at Wisley.

Mr. R. F. Calvert, of Coverack, Cornwall, put up a magnificent group, which was much admired, but the thing that created the most interest was the large number of new varieties which were shown for the first time. There was a series of fine flowers raised by The Brodie of Brodie from Fortune, including Fortune's Beauty, Fortune's Crown, Fortune's Gem, Fortune's Gleam, Fortune's Glory, Fortune's Pride, and Basra. Among the other new varieties which Mr. Calvert showed for the first time were Avebury, China Clay, Chit Chat, Cokefield, Clwyd, Cornish Cross, Cornish Gold, Coverack Beauty, Coverack Crown, Coverack Gold, Coverack Lad, Crystal, Fortitude, Golden Boy, Golden Champion, Golden Cross, Highland Chief, Helston, Hortus, Liscarton, Lizard, Manacles, Quetta, Royston, Sheeroe, Snow Crown, Westralian, White Glory, and Winkfield's Dower. When one remembers that Mr. Calvert owns the entire stocks of these new varieties, together with those he exhibited at the previous meeting, which included such fine flowers as Whiteley Gem, Tashkend, Bonny Winkfield, Bradwardine, Carnsulan, Dafila, Gilded, and Golden Bantam, some idea can be formed of the interesting and valuable collection of Daffodils he has succeeded in making during the last few years. When he was congratulated by one of the best judges on Daffodils on the number of new varieties he had been able to introduce this year he surprised him by saying that, although most of his flowers were over, he was still hoping to be able to exhibit some more new things this season, including a few really good things.

In addition to the above collection of new varieties Mr. Calvert showed many specimens of some of the best-known varieties, such as Beersheba, Alroi, Amir, Blazing Sword, Bokhara, Cicely, Corregio, Gallipoli, Gaza, Halfa, Kandahar, Mitylene, Moira O'Neill, Naxos, Nevis, Nissa, Pilgrimage, Puritan Maiden, Quartz, Rheingold, Rosary, Samothrace, Water Lily, White Conqueror, White Emperor, White Sentinel, and Yukon.

This large stand, which was 40 feet long, was broken up with a number of small upright stands all filled with interesting varieties, such as Medusa, Liscarton, Tenedos, Crœsus, Bernardino, Coverack Cheer, Chit Chat, and Firetail.

There were over 2,000 flowers on this stand, everyone of which was grown by him in his gardens at Coverack, Cornwall, and for his exhibit he was awarded a Silver-gilt Banksian Medal.

Brighton Spring Show. The group of Primula obconica gigantea in 3-inch pots shown by Mr. W. G. Bright, Hove

Spring Show at Brighton

CONTRARY to expectations, the spring show of the Brighton, Hove, and Sussex Horticultural Society, held in the Dome and Corn Exchange April 10th and 11th, proved a far greater success than the previous spring shows. Some exhibitors dropped out owing to damage by frost during the severe winter. Happily there were others ready to take their place. Within easy reach of Brighton are the well-known nurseries, Cheals, of Crawley, and Allwood, Haywards Heath, and these two firms are always well represented at the Brighton Shows.

Special mention should be made of the extensive group of Primula obconica gigantea shown by Mr. W. G. Bright, Lyndhurst Nurseries, Hove. Over 600 plants were shown, both red and white, all well-flowered seedlings in 60-pots.

Alderman Kingston, Deputy Mayor of Brighton, again won the Fox Silver Rose Bowl for a table of plants showing well-flowered Begonias, Schizanthus, Cyclamen, and Primula obconica.

A very delightful group of Orchids was put up by Sutton Bros., Woodside Nurseries, Hassocks, including a fine plant of Dendrobium nobile virginale, with six spikes of pure white fragrant flowers.

Mr. H. Anscombe, Bristol Nurseries, Kemp Town, was one of the most successful exhibitors, winning the cup presented by the Sussex Goldsmiths and Silversmiths Co., for a fine oval group of flowering and foliage plants, in which Spiræas, Dielytras, Acacias, Lilium longiflorum, Hydrangeas, Kerria japonica, Dutch Iris, and Metrosideros or Bottle-brush trees were all used with good effect. A large and beautiful group by W. Balchin and Sons, Ltd., Hove, occupied one end of the hall; it was most effectively arranged.

In addition to those already mentioned, non-competitive exhibitors included Allen-Brown, The Violet Nurseries, Henfield; April Showers, Ltd., London; Chez-Nous Nurseries, Newick (Alpines and Succulents); G. Eastwood and Son, Downs Nurseries, Hassocks (forced Strawberries); G. Miles and Son, Victoria Nursery, Dyke Road, Brighton; W. Miles and Co., Ltd., 16, Church Road, Hove; Mr. Arthur Pratt, 83, Preston Road, Brighton; and Reamsbottom and Co., West Drayton, Middlesex (Anemones).

The Society continues to make good progress, and the Secretary, Mr. H. J. Bingham, announced that the membership had now reached 2,600. Special preparations are being made in support of the Sussex County Agricultural Show, to be held at Preston Park, Brighton, June 12th and 13th. The Society's outings, which are very popular, include this year visits to the gardens at Leonardslea; Anthony Waterer's N at Knaphill; Royal Gardens, Kew Lord Dewar's garden at Ashhurst

The Society is doubling the prize in the trade section for the summe autumn shows.

Diseased Daffodils

(C. E. Butler).—Your specimens are attacked by the small Narcissus Eumerus sp., and from the appeara the bulbs there appears to be little dou this pest is the main cause of the t The adult flies appear in May and and deposit 30 or 40 eggs in each selected. rouble

. Y.).—We have carefully examined
ecimen Tulips, and cannot find any
fungoid or insect trouble. It appears
kely that some error of cultivation
to the failure. It is difficult to
for this, because you state that some
came on well. It occurs to us that perhaps the bulbs were put into the fibre late in the season. It is essential that all bulbs for fibre work should be potted up early enough so that vigorous root action takes place before leaf and short growth commence. Trouble might result if the Tulips planted were of more than one variety, because some varieties do not take kindly to fibre work and fail to make satisfactory progress.

Lilies for a light, dry soil

(Seven Rides).—Amaryllis Belladonna and Lilium candidum certainly. The African Umbrella Lily—Agapanthus umbellatus—can be confidently recommended. There is both a blue and a white form. Agapanthus Moorei is a dwarf form and would also succeed. L. speciosum or one or other of its forms could also be included; and, if it is appreciated, Hyacinthus candicans would be at home in the described conditions.

Plants for flint wall and tiled roof

(Meiktila).—The following are suggested for the roof: Sempervivum arachnoideum (Cobweb Plant), S. spinosum, S. atropurpureum, S. globiferum, S. Hausmanni, S. Pittoni, S. Thomsoni, S. fimbriatum, S. Hookeri, S. Fauconetti, S. Wulferii, Sedum dasyphyllum, S. album murale, S. lydium, S. pilosum, S. glanduliferum, S. acre, Raoulia australis, R. glabra. Wall: Erigeron mucronatum, E. philadelphicus, Convolvulus mauritanicus, Zauschneria californica, Gentiana acaulis, G. lagodechiana, Globularia cordifolia, Acæna microphylla, Acantholimon venustum, Achillea argentea, A. tomentosa, Æthionema grandiflorum, A. pulchellum, A. Warley Hybrid, Alyssum spinosum roseum, Anemone Pulsatilla, Androsace lanuginosa, A. sarmentosa, Antirrhinum asarina, Arenaria montana, Asperula tuberosa, Artemisia pedæmontana, Aubrietia Dr. Mules, A. Bonfire, A. Lavender, and others, Corydalis cheilanthifolia, Heuchera sanguinea, Hieraceum villosum, Campanulas abietina, carpatica, muralis, garganica hirsuta, isophylla, rotundifolia major, Scheuzeri, Warley, and C. barbata, Cheiranthus linifolius, Helianthemums in variety, Cotyledon simplicifolia, Encrusted saxifrages in variety, Coronilla cappadocica, Omphalodes cappadocica, Cytisus Ardoini, C. decumbens, Dianthus cæsius, D. deltoides splendens, D. neglectus, D. alpinus, D. microlepis alba, Edrianthus serpyllifolius, Saponaria ocymoides splendens, Erodium chamædryoides rosea, Erythrea diffusa,

Brighton Spring Show: First Prize oval group of flowering and foliage plants shown by H. Anscombe, Kemp Town

Geranium lancastriense, G. Pylzowianum, Gypsophila Fratensis, Helichryssum bellidioides, Hypericum repens, Lewisia Howelli, L. Cotyledon, Lithospermum prostratum, Œnothera riparia, Onosma taurica, and Oxalis floribunda. The plants will give you a quicker return, but if the weather is hot and dry spray them in the evening until they are established. Seeds of Erinus alpinus might be sown in some of the crevices. When planting, care must be taken to prevent the dry air from getting at the back of the roots.

ALPINES

Primula Winteri

I should be greatly obliged if you would tell me the correct treatment for Primula Winteri grown in a pot in a cool house now that it has done flowering.

H. L. P. BAKER.

[The two essentials for the happiness of this plant during the summer months are protection from sun and plenty of moisture. An ash plunging-bed with a north aspect protected from the direct rays of the sun is the ideal, and care should be taken to provide water, when necessary, throughout the dry season. P. Winteri may be taken out of the cool house when the other Alpines are cleared from now onwards and brought in again during early autumn.]

Alpines in stone trough

I have just put in my garden a stone trough, old and cracked, all round, horizontally, near the bottom. This will serve for drainage. I propose to plant in the trough. It faces south in full sun. Will you, please, say what plants are suitable for it?

H. S.

[The first essential is to make certain that the trough is so arranged that all water will drain out of it, as stagnant water at the root is fatal to Alpine plants. Test trough before filling with soil by pouring in water. It may be necessary to adjust the level of the trough, or even to chip a drainage hole in the bottom. Rocks built into the trough help to retain moisture during the hot weather, a most important point when exposed to the full heat of a southern aspect, and striking results may be obtained by bold effects, an outcrop being constructed to rise at least a foot above the trough sides. By this means many aspects may be obtained, and those plants requiring some protection from mid-day sun accommodated. In the soil mixture a liberal amount of stone chippings and very well-decayed leaf-mould, which for preference has been sterilised in an oven, is advisable for a southern aspect, and the plants noted below, which are obtainable at any Alpine nursery of repute, will settle down and give a long flowering period, so that there will generally be something of interest to look for in this miniature garden. For the higher slopes of the outcrop the following are admirable:—Draba dedeana, D. imbricata, Dianthus neglectus, D. Freynii, Potentilla nitida (full sun), Kabschia Saxifrages (amongst which the following have proved particularly adaptable:—Saxifraga Burseriana, S. Jenkinsæ, S. Myra, S. H. Marshall, S. Borisii), Primula Clusiana, Raoulia australis, Armeria cæspitosa. In the lower pockets many of the smaller Campanulas, such as Miranda, arvatica, Kewensis, and Waldesteiniana, and Wahlenbergia serpyllifolius major, Oxalis adenophylla, and if a sheltered corner is available with a pocket of leaf-mould Saxifrage oppositifolia splendens will be happy. At the sink-level may be planted to mat together Gentiana verna, Bellis cœrulescens, Potentilla aurea, Erigeron leiomeirus, Polygala calcarea, Viola biflora, V. Bertolonii, Primula farinosa, and Arenaria cæspitosa aurea. To fall over the sink sides selection may be made from the following:—Asperula suberosa, Androsace lanuginosa, A. Sarmentosa Chumbyi, Dryas octopetala, Phlox Douglasii, Hypericum reptans, and any of the prostrate Thymes. The hottest and dryest corners facing south may be filled with many of the smaller Sempervivums, Sedum spathulifolium rubrum, and some of the Silver Saxifrages, such as S. Burnatii, S. Cochlearis minor, S. Baldensis, and S. longifolis Walpole's Variety. It takes approximately 30 plants to fill an average-sized sink garden.]

ROSES

Rose Marechal Niel in pot

(Seven Rides).—The correct treatment has been given to the weak specimen of this fine Rose in a small pot. As soon as the shoots from the severely pruned branches attain to a length of, say, 4 inches the plant may be moved on into a larger pot—one 8 inches in diameter is suggested meantime. Drain the pot well and use a compost consisting of 3 parts old turf, rather roughly chopped, and half a part each of leaf-mould and sharp sand. The addition of a handful of bone meal would be advisable, but manure ought not to be given in the compost. If necessary, by and by, liquid manure could be given. It may be added that care ought to be taken that the plant is not exposed to draughts in the cold greenhouse. Marechal Niel is unfortunately predisposed to mildew under such conditions.

Black Spot on Roses

(B. H.).—Yes; Corry's Black Spot 40 is recommended, and you should keep it in readiness. $\frac{1}{4}$ lb. is sufficient to make a 20 gallons spray.

GREENHOUSE

Gardenias

("Bucks").—It is the low temperature that has affected your Gardenia, this plant requiring from 15 degs. to 20 degs. more than you are giving. A very moist atmosphere is also essential to success with the stove varieties, of which the specimen sent is one.

Lilies and Begonias

(Inquirer).—Lilium auratum, when grown in pots, usually blooms in July, so that you would require to place it on the north side of a wall should it show signs of being too early for your purpose. Without a number of plants it is impossible to "time" such. With several plants you can, by different treatment, be pretty certain of attaining your object, simply by placing a few in a perfectly cool place, others in a slightly-heated house, and still others in a warmer house. These Liliums, however, resent a high temperature. Lilium lancefolium (speciosum) flowers later, so you would require to give it a little more warmth than the auratum, to have it bloom in August, but strong heat must be avoided. There is less trouble with the Begonias as these continue to produce fresh flowers over a lengthened period, but to have them at their best in August, use no fire heat and shade carefully from all sunshine. Give abundance of air, but avoid cold draughts.

TREES AND SHRUBS

Honeysuckles spoilt by Green Fly

(Meiktila).—Green Fly is very destructive to Honeysuckles growing at the foot of walls, but if you pay special attention to the watering of the plants—or even mulch them and spray every 10 days with Quassia and Nicotine, according to the vendors' (Messrs. Bentley and Sons, Barrow-on-Humber, Hull) directions, you will probably steer cle
this pest. Honeysuckles growing in
exposed positions are less subject to thi
figurement

VEGETABLES

Unsatisfactory Peas

(Seven Rides).—It is unusual for wee
interfere with Peas, although they, at

KING'S ACRE NURSERIES

Established 1785 **HEREFORD** Awarded 117 Gold Medals

Special Offer for Spring Planting

ANTIRRHINUMS

The Cheapest and Best Bedding Plants obtainable

The best effects are obtained by planting in masses, whilst beds of special colours may be planted according to the colour scheme decided upon, and in borders the tall varieties should be planted at the back, following on with the intermediate kinds, and edged with the dwarf and Tom Thumb varieties.

TALL VARIETIES, growing about 2 to 3 ft.

Bonfire—Bright cinnabar-red, yellow blotch
Cerise King—Rich cerise-pink, white throat
Cottage Maid—Very handsome pale pink, white throat
Crimson King—Beautiful rich crimson, very fine flowers
Orange Beauty—Orange-scarlet, gold tipped
Queen Victoria—Large white
Rose Dore—Self salmon-rose, shaded gold
Yellow King (Majus)—Deep golden-yellow

INTERMEDIATE VARIETIES, growing about 1 to 1½ ft.

Black Prince—Intense crimson
Bonfire—A beautiful orange and flame colour
Canary Bird—Pale shade of pleasing yellow
Carmine Queen—Rich rose-carmine
Cottage Maid—Pale coral-pink, white throat
Daphne—Coral-rose, white throat
Fascination—Deep flesh pink
Golden Monarch—Golden-yellow
Golden Queen—Deep yellow
Morning Glow—Terra-cotta, orange
Nelrose—Deep rose-pink, very popular
Scarlet King—Rich scarlet, fine
The Beacon—Beautiful salmon hue
Vesuvius—Deep vivid orange or flare colour
White Queen—The finest white bedding variety

DWARF VARIETIES, growing about 6 ins. high.

Apricot Queen—Apricot
Brilliant Crimson—Rich crimson
Delicate Pink—Shell pink
Orange Scarlet—Rich orange-scarlet
Rose Queen—Rose
Snowflake—Good white variety

Very suitable for edging.

The plants offered are hardily grown, and can be successfully planted from March to June. We have retarded plants for later planting.

Prices—Single dozen, **2/-**; per 100, **10/-**; per 1,000, **90/-**.

Carriage paid, packing free, for cash with order. **Nurseries 130 acres.** Late Cranston's

Bedding Plant Catalogue Free on Request

be cleared off by syringing with cold water, and plenty of it, applied with some force. Not only Peaches and Apricots, but all wall trees in a warm exposure ought to be thoroughly watered during dry weather. A mulch of well-rotted manure or of leaf-mould would prevent undue evaporation.

Blood manure and Vines

(R. Humphreys).—You surely do not intend to use fresh blood in your vinery, seeing it would cause such a horrible smell, and, anyway, much better Vine manures are to be had without any of these objectionable drawbacks. Full reliance can be placed on Thomson's Vine and Plant Manure, Wood's "Le Fruitier," and others advertised in our columns. If you must use blood procure the dried article and use according to directions.

MISCELLANEOUS

Books on Violas

("Japonica").—Books on this subject are now very scarce, but Messrs. D. Macleod, Ltd., Publishers, Cowgate, Kirkintilloch, Dumbartonshire, offer two—"Violas and Pansies," costing 10d. post free, and "Pansies and Violets," 1s. 3d. post free, and these may suit your requirements.

Plants for classification

(G. H. Spinney).—Few plants in this list from Tokyo will be of any use to you, but we have classified all we possibly could, and this should assist you in determining which to try. The seeds you have no desire to keep would probably be acceptable to any of our nurserymen who cultivate stove and greenhouse plants, such as Messrs. Clibran and Sons, of Altrincham, Messrs. Russell, of Richmond, or Messrs. R. Veitch, of Exeter. You might care to advertise them in the columns of GARDENING ILLUSTRATED. (1) A composite, hardy only in favoured districts. (2) Probably greenhouse shrub. (3) Strong-smelling annual from New Zealand. (4 and 5) Greenhouse plants. (6) The She Oak of Australia (greenhouse evergreen). (7) Indian trailing plant, requiring stove temperature. (8) Stove evergreen. (9) Probably from New Zealand, tree or shrub (greenhouse). (10 and 11) Stove annuals—allied to Senecio. (12) Similar to Staphylea, and would probably succeed in the open. (14) Greenhouse evergreen—flowers white. (15) Greenhouse—tuberous-rooted. (18) Greenhouse evergreen shrub from New Holland. (19) Stove evergreen. (20) Primulas, unable to trace these.

Heating Tomato house

(R. R.).—For a house of the suggested dimensions 4-inch pipes—a flow and return—right around the house would be necessary, and a Robin Hood Junior Boiler would be well up to the work. The pipes may be placed where most convenient, but preferably along the back wall and the front of the house. The latter ought to have a door at either end, and plenty of provision for free ventilation is indispensable. Make a hard path of the width of the doors from end to end; prepare well the border, and allow 2 feet between the plants in the lines—these being also 2 feet apart. The needful work of training and tying can be attended to by an arrangement of light foot-boards. It is not necessary to brick in the beds. A smaller house at the boiler end, with a double flow and return of 4-inch pipes, would be of great benefit, as young plants could be brought to the planting stage more quickly than if seeds were sown in the larger house. Any further details will be gladly given.

NAMES OF PLANTS

V. B., Glengariff.—1, Acacia retinodes (syn. A. fragrans); 2, A. verticillata; 3, A. armata var. angustifolia; 4, A mucronata; 6, A. armata; 7, A. Baileyana.

W. N. E.;—2, Arabis lucida variegata; 3, Saxifraga moschata variety, no flowers were open on this kind; 4, Saxifraga decipiens grandiflora (Bathoniensis). No. 1 not in box.

NEWS IN ADVERTISEMENTS

Lefco ornaments

It is interesting to note that the material used in the construction of Lefco garden ornaments is of a similar nature to that used in some of the well-known buildings in London. This is evidence of the ornaments' durability, and their powers to withstand rain, frost, and sun. The new catalogue of the Leeds Fireclay Company, the manufacturers of the ornaments, contains an extremely wide range of models, and is worth studying. It can be secured from the Company, Dept. C.S.49, Wortley, Leeds.

Cultivation of Beetroot and Sugar Beet

The Sugar Beet, now grown by the acre in this country, is a root plant of the same family as the Mangold. Properly cultivated, it is a long tapering root of a shape and colour similar to a Parsnip, but larger and broader at the top. Its weight, excluding the crown and leaves, averages from 1½ lbs. to 2 lbs. Unlike the Mangold, it grows almost entirely below the surface.

The best soils are deep loams, well supplied with lime and organic matter. Any free-working soil, however, adapted for growing roots, Barley, or Potatoes should grow Beets well. Very shallow soils should not be used. In such conditions, instead of a long tapering root, the Beet is apt to take a Mangold shape and develop fangy roots.

It is usual to grow Beet as a cleaning crop in the rotation, replacing Mangolds, Swedes, or common Turnips. There is, however, no hard or fast rule for the place of Sugar Beet in the rotation.

Practically all the manure in the rotation is applied to the Beet crop. The crop will not exhaust the soil, and the manuring, together with the thorough cultivation, will improve and clean the land for the succeeding crops.

In general, the manurial treatment is that usually necessary for a good Potato crop. This will, of course, vary in different localities according to the nature and condition of the land and the manuring of preceding crops.

Farmyard manure should be applied in the autumn; phosphate, potash, and sulphate of ammonia should be harrowed in when preparing the seed bed, and nitrate of soda should be applied immediately after singling. As a general guide, the following dressing of fertilisers may be suggested:—

1½ cwts. sulphate of ammonia,
4 cwts. superphosphate,
2 cwts. potash salts (30 per cent)

harrowed in before drilling, followed by 1 cwt. nitrate of soda as a top-dressing immediately after singling.

Where the land is deficient in lime it is important to apply it or factory lime waste in the autumn or early spring. Up to 2 tons per acre of lump or ground lime, or, if near a factory, factory lime waste at the rate of 4 tons per acre.

A good seed bed is essential. A faulty seed bed is often the cause of a patchy field of plants. The seed should be drilled
ably on the flat in rows about 18 inche
and not more than 1 inch deep.

Success, however, very largely depe

GEO. VINT & BROS. Idle, Bradford, Yorks.

SUTTON'S PANSY,
"ULLSWATER."

Mr. J. Comber, writing in the "Gardeners' Chronicle," says:— "Those who were fortunate enough to include this Pansy among their trials of novelties, are likely to repeat the order or even increase it. Having grown it during the past season, I can strongly recommend others to try it. The flowers are large and well formed, and the colour is a dazzling true blue. The intensity of the blue-black blotch in the centre is enhanced by a minute eye of white and yellow."

Per packet, 5s. and 3s. 6d., post free.

SUTTON & SONS, The King's Seedsmen, Reading.

CURTIS'S Nine Star

PERENNIAL BROCCOLI

THIS WONDERFUL NEW VEGETABLE provides the following March, April and May an abundant crop of Broccoli, nine heads on every plant, and reproduces every year. **No frost will kill them** and they are fit just when there are no green vegetables about. You must try them. Order Plants now for delivery in May and June.

Seed, 1/- & 2/6 a packet. Plants 6 for 1/6 2/6 doz, 10/- 50, 18/6 100.
Post paid for Cash with order, or C.O.D. 6d extra.

TESTIMONIALS

MR. G. U. ANDREWS, ROSS-ON-WYE (WHERE THE FROST WAS GREATER THAN ANY PART OF THE U.K.), SAYS: "They stood the severe frost splendidly; everything else cut clean off."

THE REV. A. V. CLARKE, NETTLETON, WRITES: "Your Nine Star Plants are the only greens which survived the terrible February weather."

MR. F. WILKINSON, BASINGSTOKE: "Plants I had last spring have come through severe weather remarkably well."

LAWNS Require Attention—NOW

NOW is the time to feed your lawns in preparation for the summer months. A reliable complete fertilizer will quickly create dense turf. Moss, clover, and weeds should be eradicated now by applying Fisons' Lawn Sand.

Fisons' Technical Bureau is maintained for the benefit of enquirers, without obligation.

FISONS' LAWN GUANO

(A Compound Fertilizer)

The safest dressing for turf. It feeds the turf over a long period and will not burn or discolour the grass. Lawn Guano quickly strengthens the roots and encourages a dense growth of fine grass. As used by important clubs and municipalities. Apply now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**5/-**	**9/-**	**15/-**	**25/-**

FISONS' GRASS SEEDS

are the finest procurable, being specially tested before selection. Special Mixture (for Bowling and Golf Greens, finest grasses only).

Prices, in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**15/6**	**30/-**	**58/-**	**110/-**	**210/-**

FISONS' LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and so doing stimulating the grass. A thimbleful destroys a large weed, such a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for regulation doubles tennis court. Measure and full instructions sent.

Prices, in Kegs :	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**5/-**	**9/-**	**16/-**	**27/6**

FISONS' POWDER WORM KILLER

Is most effective against worms and is safer and cheaper than other preparatio It is convenient to use and a forced jet of water is unnecessary. Apply 4 ozs. to t sq. yd. or 1 cwt. to a regulation doubles tennis court. Full instructions sent.

Prices in Bags :	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**2/6**	**4/6**	**7/-**	**12/-**	**20/-**

Novelties at the Daffodil Show

Daffodil Show held in Vincent are on April 16th and 17th, and re- ed elsewhere in this issue, was re- e for outstanding novelties of d distinction, also for the splendid n blooms sent by growers in Ireland nwall. Although the Show had been d a week the date was still too early growers.

Show attracted specialists not only l parts of the British Isles, there an invasion of discerning and dis- ing buyers from Holland.

said that bulb growers in Holland are to replenish their stocks of bulbs, as ses have been very heavy during the nter, which was even more severe in than in this country.

interest was also taken in by Covent Garden ex- d, as remarked by a lead- bitor, the London Daffodil becoming an auction, at ew Daffodils are bought ighest bidder.

lil specialists were to be wsing for long intervals corner of the hall where D. Williams staged a of his newest seedlings, which were unnamed.

pick of Mr. Calvert's ncluded Coverack Gem— rful flower and the talk of w—J. K. Ramsbottom, double-flowered Cheerful-

nnot speak too highly of derful collection staged by . Richardson, of Water- r which the gold medal rded. We have grown to reat things from Water- t the flowers this year fer than ever, not only in also in depth of colour. istance, that marvellous Hades, with its intense ed corona, was even of ue than ever this year. nothing to approach Hades depth and warmth of its oured corona. It probably l more attention than any wer in the Show. Another emarkable for its depth of as Copper Bowl (Beacon e), so admirably shown by Wilson, of Broughshane, rim, who won the Engle- Challenge Cup for 12 raised by the exhibitor. ies to receive the Award r were :

Solleret, a large Jonquil hybrid, raised by Mr. Engleheart and shown by Mr. W. B. Cranfield.

Adventure, a bold, upstanding variety, with all the appearance of a Trumpet Daffodil, but shown as an Incomp. It has broad, rich yellow perianth, and was the subject of great admiration (see illustration, page 281). Shown by Mr. F. Herbert Chapman.

May Malony—as a Show flower—a well-formed Leedsii, raised and shown by Guy Wilson.

Beersheba, the grand white Trumpet that has gained many honours, is now granted the Award of Merit for cutting.

Carminowe, the Barrii here illustrated, was awarded the premier honour, and scored full points for condition, form, texture, colour, and pose. Shown by Mr. Richardson.

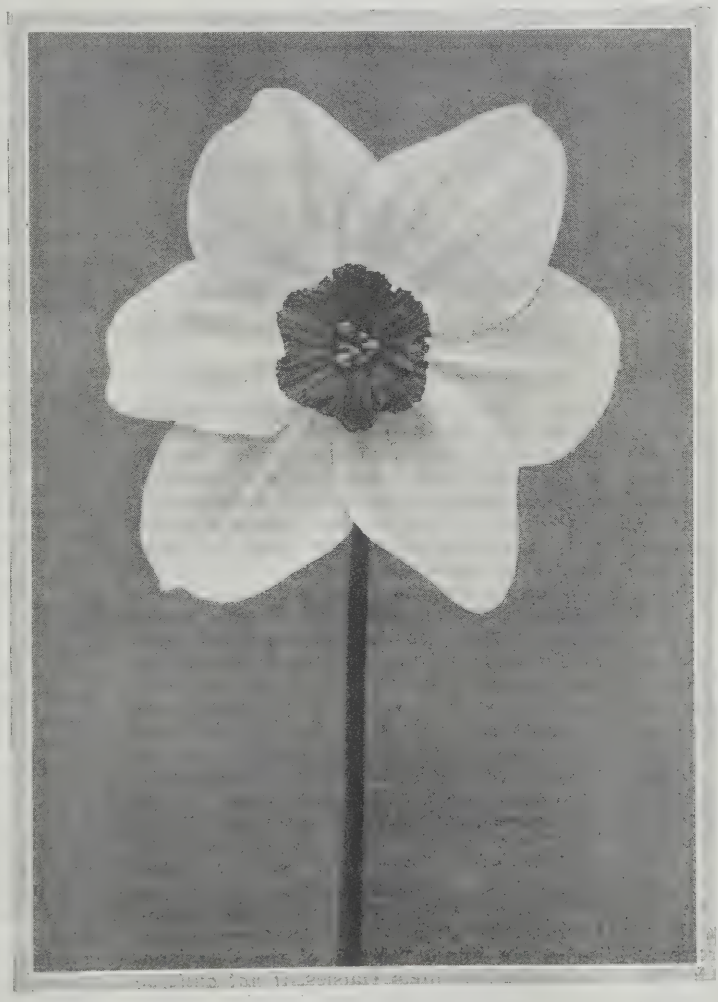
The Gold Medal was awarded to the Donard Nursery Company, Newcastle, Co. Down, for a superb exhibit, in which white Trumpets, Beersheba, Eskimo, Kantara, and Everest were much in evidence.

Outstanding exhibits included Mr. Secrett's wonderful and bold display of Poets; a beautifully arranged group by Sutton and Sons; Advance Guard and Fortune, so well shown by R. H. Bath, Ltd.; a comprehensive group by Barr and Sons, in which Cædmon, Sunrise, and Fortune's Queen were remarkably good.

Daffodils that caught the eye on various stands included :

Fairy Cycle, Mystic, Suda, Glorious, Medusa, Royalist, Mitylene, and Firetail.

The claims for new varieties embrace the most interesting features of this Show, and Mr. Guy L. Wilson was first with 12 varieties raised by himself. This is a great honour, of which any raiser is justly proud. His variety New Moon was especially fine. Mr. Guy Wilson is this year going to New Zealand to see the Daffodils there. The announcement that the Peter Barr Memorial Cup (presented annually to someone who has done good work on behalf of the Daffodil) was awarded to Mr. G. W. Leak, of R. H. Bath, Ltd., for his work as a hybridiser, was greeted with applause. H. C.



Carminowe, awarded the Banksian Medal for the best bloom in the competitive classes

Campanula Hallii

We are fortunate in possessing a goodly number of hybrid Campanulas for the rock garden, and the charming little Campanula Hallii ranks among the most precious. It well deserved the Award of Merit bestowed by the Royal Horticultural Society on August 8th, 1923, and its progress into favour has been remarkably rapid and consistent. It is of the type of Campanula Bellardii, and yields its exquisite pure white bells in profusion for months in summer. It is an excellent plant for the rock garden, either on the level or in crevices of the rocks, while it is a delightful subject for the wall garden. It is a good grower with the ordinary treatment of other rock plants.

S. Arnott.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

The great frost

THE effect of the great frost, so far as can be ascertained at present, was most capricious. Fremontia californica and Faluja paradoxa never turned a hair, whilst Carpenteria was severely burnt. Hoheria populnea merely lost its leaves, yet many Hymenantheras were killed. Lagerstrœmia indica on a wall was untouched; hard by, Buddleia auriculata is severely crippled. Young plants of hybrid Helianthemums escaped undamaged, and old plants were killed. Roses like R. macrantha, R. levigata, R. sinica-anemone are breaking into growth right down the branches. Chrysanthemum Mawii from the Atlas, and Putoria calabrica from Spain, were killed; Triptillions from the Argentine Andes survived. Celmisias have come through well, but Diplarrhena Moræa and Milligana Johnsonii are dead. The dry weather has suited the Pæonies admirably; of less common varieties P. Cambessedesii is showing four flowers, P. Smoutii five or six, and P. Brownii two. The Moutans, notably "Elizabeth" and "The Tycoon," are in splendid fettle. Irises promise very well; certain garden Irises which were very sick last year and were transplanted are making wonderful recoveries, and the Oncocyclus Iris and wild species are first class. Tender things like I. Wattii, I. Japwat, and I. japonica pl. var. suffered a little, but are all right. It is clear that the enemy of the Riccardi Hybrids is wet, not cold, and I am planting out all Prof. Mitchell's hybrids in my sand garden. Tulips are quite free from fire, and I have never seen T. Kaufmanniana better. Lilies, Lycoris, and other Amaryllidæ are very strong. Four established plants of Daphne Genkwa are in full bud and Mimulus glutinosus breaking from the base.

Tender shrubs in the gardens near Minehead suffered cruelly. The two very old Acacia dealbata at Dunster Castle are dead, and the Benthamia in the churchyard severely damaged. At West Porlock, in Mr. and Mrs. Blathwayt's garden, the Leptospermum hedges are destroyed, and only one tree of the many varieties of Acacia has survived. The Cordylines were badly hit; the crown of a great tree was lying across Mr. Hadden's doorstep. Telopeas have furnished the surprise; Telopea truncata has proved hardy in the most exposed positions, and Mr. Loder tells me Telopea speciosa is unharmed with him.

WILLIAM LAWRENCE.

Celmisias from New Zealand have stood the winter well

Blue flowers

With reference to a recent article on blue flowers by W. Auton, would your correspondent verify the colours of Anemone hepatica and A. apennina and let us know the result? I do not mean in a general sort of way, but a strict colour description. It may interest him to know the spectrum shows them between purple and violet.

And I would like the name of the true blue Aubrietia, as I wish to use it to replace a bank of Forget-me-nots, which are sometimes shy in seeding.

But surely Mr. Auton is forgetting the title of his article when he mentions "primroses from pale blue to deep violet." Incidentally, I have yet to find the blue primrose which fades a real blue or does not reveal any other hue in the spectrum

When reading your Jubilee number I was impressed by the wonderful advance generally made in horticulture, and especially with the accurate information given to one in horticultural journals, but it did strike me very forcibly that colour description stands to-day exactly where it did fifty or more years ago. Cultural treatment is always given simply but accurately in your columns, botanical descriptions are exact, plant descriptions leave little or nothing to be desired, yet colour description is often incorrect and misleading through the use of extremely loose terms, and the surprising thing is that such inaccuracies are seldom questioned. In the article under review are the words (the italics are mine) "Many of the Campanulas and Michaelmas Daisies, *if not quite so blue* as the Delphiniums," which means nothing. Blue is blue; it may be light or
dark, strong or weak, but if it is not s
as something else then it cannot be
Other looseness of descriptions are "
shades of blue of the Iris." These are
purple. "Lupins in various shades of
and purples." They are practical
purple and purple is inadmissible in
plant article. Native Geraniums are in

Plants running to seed

Certain members of the plant world
to have a strong passion for perpe
their line. They seem to have a "r
conviction that they must not depa
life, without providing an heir, and if
demise threatens, they hasten headl
reproduce themselves.

The common Dandelion, growing
hedge, spreads itself, runs into leav
foot in length, and is in no special h
flower. But in a lawn it is a stunted
little more than a flower spike—and
less.

On walls and other places where
are necessarily short-lived they seem
to seed quickly—and to very little else
strength is in them, what nourishme
can derive from bricks and mortar,
solely for purposes of reproduction.

When bamboos flower it is generall
as a sign that they are going to die.
last despairing effort is towards p
tion of the species.

The peculiarity has been noted and
to use. The Aloe, which shares w
Tulip tree and a few other members
plant world the distinction of flower
rarely, is sometimes artificially stimu
blossom. Gardeners cut off its roots,
plant, fearing that it will die, has
flower and bear seed.

world's goods, is the soul of generos- was able to give her a few things to me, including a really nice lot of n blooms, which, as she was paying n her way home, were seen by an ance who is *not* a gardener. ly scenting something for nothing, greeted a few days later: "Oh, I s. —— the other day. She told me t your garden. I *would* so like to d see it—may I?" What could I "Yes." Well, she came, and as we tour there appeared another, such who began the same tale of having s. —— and "I simply *had* to come the garden." Off we started again, ing duly paid polite attention to a od colony of Erythronium revolu- nsoni, they began to gossip about eighbours; they discussed the tea- that they had been to recently, the each person had worn; everything ll thrashed out while they marched e garden, with myself walking be- hey were still thrashing it out when ack to the house again, never having to look at a single plant; and they d good-bye and how much they had the garden, and "would *simply love* again." (Not if I can prevent it!) id not send them off with any gifts,

Mr. Bowles have done so? I think all his kindness and generosity, ave been tempted to push them into River.

"NIL ADMIRARI" SECUNDUS.

Apple Ashmead's Kernel

Mr. Baynham's remarks in your paper for April 13th *re* this old Apple are very interesting, and speak well for its behaviour with him at Chambers Court, Tewkesbury; where it is far from having a shy-bearing reputation. I had no idea it is looked upon as a poor cropper. It is, I know, considered by many to be of excellent quality, and I think worthy of note for extended cultivation, for good Apples of this type from April onwards are worthy of appreciation. Last year I was asked by a keen pomologist if I could obtain for him a few grafts from Gloucestershire of the true old Ashmead's Kernel Apple as he had a very high opinion of it. I was successful in obtaining these through the kindness of a friend who is well acquainted with the orchards in that county; also working upon the Paradise stock a few trees for myself, which are coming on well.

Some years ago I knew an old tree of this variety, but it was in a declining state and made no wood suitable for grafting, but even from this old relic the fruit was of good flavour. This was but a few miles from Chambers Court, and it was a surprise to me on reading Mr. Baynham's remarks that so many trees existed in his locality, as I was under the impression it was getting extinct. Many of the old orchards of Gloucestershire contain good Apples of unknown parentage, these originating as seedlings from the cider mills and known only under local names, but some of really good quality. Soil and locality have a marked effect upon the flavour and appearance of many Apples, some of which I would scarcely distinguish on the soil I am now interested in, it being less favourable than the fertile marl of the Severn Valley.

"NORTHANTS."

Queen wasps

Although the winter has been a severe one it has not appreciably diminished the numbers of queen wasps. Doubtless, after the abnormal quantities of these pests in the course of last year, we need not be surprised that many queens have survived, and it behoves us, at this time, to destroy as many as possible, remembering that each one killed at the moment means a nest less with which to contend when the fruit ripens. The potential mothers are sluggish on the wing just now and are comparatively easily caught. Up till now (April 22nd) I have accounted for 17, these being killed, chiefly, in the vineries and in the fernery, in both of which structures the warm, moist heat appears to possess an attraction for the wasps. Later on, when the bedding plants are put out to harden, it has been my experience that considerable numbers can be killed frequenting the boxes and frames. It is, surely, worth while to do what one can to lessen the plague of wasps. A SCOTTISH GARDENER.

Narcissus Pepys

I noticed the illustration in your last week's issue (page 272) of the Cyclamineus hybrid I exhibited at the Daffodil Show last week. This was raised by Mr. P. D. Williams, and he informs me that he has named it "Pepys." F. A. SECRETT.

Marsh Farm, Twickenham, Middx.

THE DAFFODIL SHOW

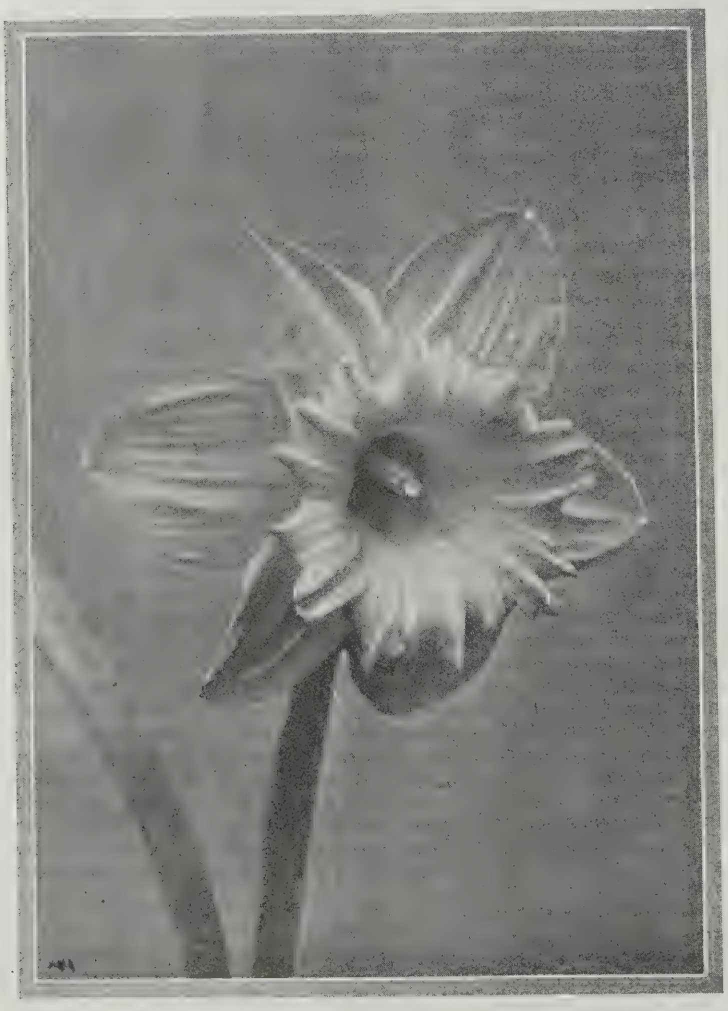
By Guy L. Wilson

A time of pleasant incidents and reunions

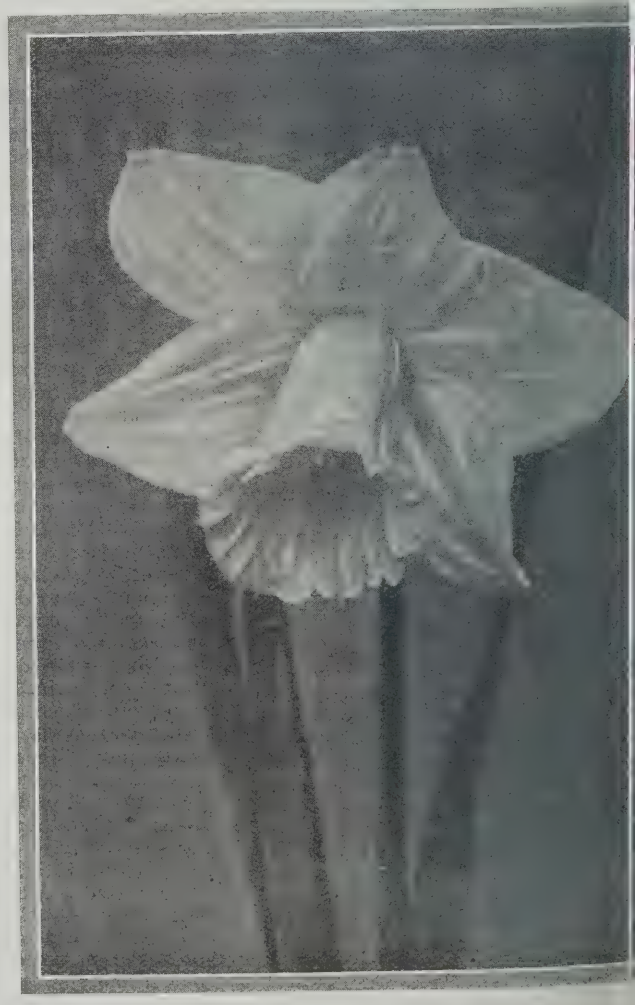
THIS gathering of most of the world's greatest Daffodil breeders and growers, and such of their flowers as they could bring, was, as usual, for them and for keen lovers of the Daffodil the most interesting event of the season. The quantity of flowers shown, and the quality of some, was rather below average. That they were not a very great deal worse was surprising, as, during the first three months of the year, England passed through a spell of frost of almost unprecedented severity and duration, since which there has been practically no rain. The effect of this weather was apparent in some of the flowers, while in many districts they were so retarded that growers were unable to exhibit. In consequence there were not so many entries as usual in competitive classes.

Owing to the lateness of the season the show had been postponed for a week, but had it been postponed even longer we should in all probability have seen a fuller and better balanced display. As it was the Irish and Cornish growers had an unfair advantage; their districts lay outside the area of the most severe weather and their flowers were in beautiful condition. We always expect something of superfine and super-refined quality from Mr. P. D. Williams, of St. Keverne, Cornwall, and we were not disappointed. His groups in one corner of the hall were the last word in quality and perfect condition, beautifully staged without overcrowding. Two of his flowers were quite outstanding. One was called Crocus, a big, tall Trumpet with just a touch of Incomparabilis in its composition; its spherical perianth of immense growth, circular and flat, stood at right angles to the beautifully proportioned flanged trumpet. The flower was of great substance and of solid, uniform, darkest brilliant golden colour throughout, a unique flower. The other, Porthilly, was a tall Incomparabilis of perfect balance and lovely form, with smooth, broad, clear yellow petals and solid, blazing-hot, orange-scarlet crowns, wonderful brilliant, almost scarlet and gold flowers. There was also a big Leedsii of wonderful quality with somewhat star-shaped, slightly reflexing, clear white perianth of smooth, solid texture, and goblet-shaped, clear primrose crown, and a beautiful Barrii of great size and smooth, clean, refined texture that had immense rounded perianth of clearest white and a beautiful saucer crown, clear citron-primrose with a ribbon of clear orange-red.

Mr. J. L. Richardson, of Waterford, Ireland, had a 44 feet exhibit of truly magnificent Daffodils, the centre-piece of which was a bunch of half-a-dozen flowers of Hades, which he has shown befo never quite so fine. I always thou wide cup was the darkest bit of colour seen, but this time it showed a g brilliance and fire of scarlet that w astonishing. Around it were grouped vases of the most glorious blooms peerless white Trumpet, Beersheba, have seen, of immense size, perfectly ful form, pure white with cool green their trumpets, tall, stately, serenely ful; unquestionably the queen of D The Donard Nursery Company, al Ireland, had a splendid group for wh Mr. Richardson, they were awarded Medal. On their stand were two ex ally good seedling yellow Trumpets, t Trumpet, Eskimo, in fine condition noticed a good bunch of what is prob rarest of Daffodils nowadays, cernuus plenus. Mr. R. F. Ca Coverack, Cornwall, also had an group of very fine flowers, amongst new giant Barrii named Coverack outstanding. It had very huge, ivory perianth and very wide sauce full of glowing colour. Bokhara w Incomparabilis of good quality and s with a fine orange-copper cro Penzance, a large Leedsii of beauti and quality. Messrs. Barr's group



Grand Master, rich golden yellow, a market flower for forcing, resembling King Alfred and claimed to be a fortnight earlier. Note the wide and deeply frilled trumpet. Shown by Tyler Bros., Southrepps, near Cromer



Gregalach, one of Richardson's best, with long lemon trumpet and ivory-white perianth—a flower of smooth, clean, and texture, perfect in form and pose.

le range of varieties, amongst which
Diamond stood out. This is a huge
with solid ivory perianth and deep,
red eye. They also had the Poet
non in beautiful condition. I was
d to see in Messrs. Sutton and

est flower in the competitive classes.
upremacy of Beersheba amongst white
dils was more firmly established than
as in the single bloom class it won the
second, and third prizes, the first prize
grown by Mr. J. L. Richardson being
rvel of size and beauty. In the seed-
lasses some beautiful new flowers were
n. Mr. Richardson had a series of
bicolor Trumpets bred from Cleopatra
hite Knight that were wonderfully
ful, huge, of superb waxy texture,
clear colouring and grand form, with
breadth of petal and beautiful round,
hly rolled-back trumpets.

J. S. Arkwright showed a most inter-
flower named Corgi, an Incompara-
of a most distinct biscuity-buffy-
tty colour. In the classes for Leedsii
ies some flowers of great merit and
were shown. Several raised by The
of Brodie were outstanding, namely,
ora, very tall, very large, smooth, and
lid, waxy texture, lovely form with
, flat, very wide perianth, and not too
crown, nearly white throughout.
thes, of most charming form, milk-
, with a gracefully flanged and frilled

le flower of great stature, broad white
th, and big, frilled, cream crown
id with warm apricot-pink, a great
y. There were very many other flowers
perlative merit, but time and space pre-
l further detail.

show time is always full of pleasant
nts and re-unions with our Daffodil
s. As I sat at an improvised table by
and arranging flowers the evening be-
the Show I felt a light touch on my
lder, and, looking round, found myself
to face with the high priest of the
dil, Mr. Engleheart himself, who, since
saw him some years ago, had passed
gh a severe illness. I was delighted to
him looking in the best of health. He
bviously pleased to meet again many of
lowers he had raised, especially Beer-
l, which, I think, he considers the most
iful of his children. He tells me that
ll has some fine whites coming on, and that he is now at work on a wonderful strain of pink-crowned flowers.

Helen O'Hara, a beautiful long trumpet. The whole flower is pale primrose, passing to ivory-white. Admirable for cutting

On the second day of the show Mr. A. F. Calvert made me the most acceptable gift I have had for a long time, namely, a copy of his book, "Daffodil-growing for Pleasure and Profit." Mr. Calvert, who is a comparatively recent recruit in the ranks of Daffodil lovers, has used his remarkable gifts of energy and organisation in the interest of the flower in securing chapters on every aspect of breeding, cultivation, and marketing from all the greatest and most experienced authorities on these subjects. The volume is a bulky one of some 380 pages, in addition to which, at the end, are upwards of 200 photographs of Daffodils, many of which are good, and some not so good. I read as much as I could of the book on my way home in the train. The more I read, the more did I realise that Mr. Calvert has rendered the flower and all who grow it and love it a service of infinite value in getting together and publishing what really seems to be most of the knowledge and experience of the outstanding growers, past and present. Such a work was long overdue and ardently wished for, and in producing it Mr. Calvert has accomplished something that seemed beyond the rest of us, and has made us all his debtors. When it is realised that the book contains contributions from such authorities as Mr. Engleheart, Mr. P. D. Williams, The Brodie of Brodie, and Mr. A. M. Wilson, no Daffodil lover will rest content till he has obtained it. I have not yet had time to explore the wealth of information on pests and diseases, and other important matters contributed by competent authorities, but I am simply astonished at the amount of invaluable information that has been got together in the book, and feel quite sure that it will prove a very considerable help forward to the important and growing industry of bulb and flower production in Great Britain, and at the same time it will be of the greatest assistance and encouragement to amateur growers.

Tulipa præcox

This beautiful species, introduced in 1825, is, according to Baker, only a geographical form of T. Oculis-solis, and not a distant one either, as the latter was obtained from the South of France in 1816. For gardening purposes T. præcox is much the finer; it has a strong, upstanding habit, the stem often reaching 18 inches in height. The bud, 3 inches or more in length, is soft red on the outside, with a large blotch of yellow at the base, the whole shining like satin in the sun. As it ages the flower opens and flaunts its uneven petals widely, displaying a black eye, two inches across, margined with golden yellow, the inside of the petals being brilliant scarlet.

When I first grew Tulip species, I was told that it was necessary to take them up each summer, ripen them, and replant the following November. This may be imperative in some soils and with certain species, but it certainly does not apply to all. Many will grow on without lifting, improving each season, but, of course, they must be taken up and divided when they become crowded, generally in the third or fourth year.

J. Comber.

May Malony, the lovely and delicate Leedsii for which Mr. Guy Wilson gained an Award of Merit. There is delicacy and charm about this tall-growing, refined flower, with its rich primrose-yellow corona, and cream-white perianth

St. Egwin, a well-made Giant Barrii show flower of perfect form, co
uniform clear soft yellow. Note the broad, overlapping segments of
perianth, rounded and of good poise, standing over 2 feet high. Sh

A Rock Garden in April

Choice Alpines and early-flowering shrubs in a small garden

THOUGH biting frosts and a long-delayed spring prophesied widespread destruction, Alpine plants, on the whole, though unprotected by the winter blanket of snow which keeps them warm and snug on their native mountains, have come through a severe ordeal with flying colours. Lithospermums have perished—I hear sad stories to this end from many districts—Helianthemums have been badly cut, often killed, and, of course, that vivid South American, Verbena chamædrifolia, has utterly vanished. Though it can never be reckoned a hardy plant, this is well worth replanting every year for the extraordinary brilliance of its dazzling scarlet flowers. Yet we have lost relatively few Alpines, and my rock garden is already splashed with patches of colour, while vigorous growth has been evident in rapidly increasing degree during the past fortnight, and promises much for May and June. A plant which, however, has broken its promise for three consecutive years is Omphalogramma vinciflorum, the best of a whimsical race. Though it has the half-shade and moist soil, which all the Omphalogrammas prefer, true to its family characteristic, it has, so far, been too lazy to produce its lovely Periwinkle blue flower.

The first to bloom this year was the dwarf Rhododendron moupinense. I have a pretty form with flowers pink-and-white like Apple-blossom. In early March its fat buds split to produce flowers which withstood frost and wind with amazing hardiness; a valuable garden shrub, this, flowering freely the third year after sowing seed. All Fools' Day was greeted by the first bloom of Narcissus minimus, a month later than usual; this is the smallest and dwarfest of all Daffodils, with dainty little trumpet-flowers of rich golden-yellow on 3 inch stems. It likes a peaty soil, and has become well established with me, piercing up every year through a carpet of Campanula tyrolensis. This Campanula, by the way, is not often seen; it resembles a dwarf C. pusilla, of which it is probably a form, scarcely 2 inches high, with the daintiest of pale lavender-blue bells. Other Narcissus species at present in flower are N. cyclamineus, also very late, N. Triandrus albus, and the much larger form N. Triandrus calathinus.

I am glad that I did not trim away the withered, dead foliage of a large patch of Hypericum reptans, for it now makes a very effective russet-brown carpet, in beautiful contrast to the spikes of Muscari conicum Heavenly Blue which grow through it. Of other bulbous plants a few blooms of Iris reticulata still linger, and I have found some healthy growths of the little yellow Fritillaria armena from Asia Minor, planted 18 months ago. At the foot of the rock-garden, a group of Tulipa Eichleri is just showing its flower buds and will soon be the brightest spot in the garden. This is a truly magn
species from Turkestan, with broad, n
flowers, often 9 inches across, of
scarlet, with a glowing black-and-gol
T. Clusiana, the Lady Tulip, is happ
warm, stony slope, while higher up T.
and T. linifolia are thriving. The latt
particular favourite; its olive-green lea
daintily undulated, and margined with
line of crimson, and spread almost h
tally over the ground; in three weeks'

appy association of early-flowering
is Rhododendron præcox and Erica
. These are very close in colour and
nise delightfully. Plant some Daphne
eum album alongside, and you have a
at is hard to excel in the early days of
. Behind these I have also growing
lia stellata, whose rosy-tinted buds have just expanded their snow-white strap-petalled flowers. Mention of Erica carnea reminds me that there is a very fine form of this useful heath called E. Vivelli. It flowers a few days later than the type, and is a beautiful deep rosy-carmine in colour. Other combinations of flowering shrubs that are effective later on are the double pink Cherry, Cerasus Hizakura, with creamy cytisus præcox; the pale blue powder-puffs of Ceanothus Gloire de Versailles with Perowskia atriplicifolia, a beautiful Himalayan sage-like shrub, with long, spiky heads of violet-blue flowers over greyish foliage; these are two valuable shrubs for autumn effect. I also look forward to seeing in September and October the large scarlet hips that Rosa Moyesii bears so freely, beneath which I have planted Berberis Thunbergi, whose graceful arching sprays of brilliantly-tinted autumn foliage blend perfectly with the fruits of this fine Chinese Briar.

Many other suggestions run through my mind, and I might proceed indefinitely, both in practice and on paper, were it not that my garden is small and space in these pages limited. R. G. W.

Alpine lawn and rock garden

The nursery

Most gardens possess a small nursery, or reserve, where choice subjects are planted from small pots and boxes until more is known of them, or until they have grown large enough to take a place among established specimens, and it is usual to transfer a number of these to the shrub and flower borders each year. Thus space becomes available for the planting out of more recently propagated material from small pots, etc., which have been wintered in cold frames.

A trio that is hard to excel in the early days of spring

A happy association of early flowering shrubs

Rhododendron præcox, Erica carnea, Daphne Mezereum album, with rosy-tinted buds of Magnolia stellata in the background

The Spring Show of the National Rose Society

OWING undoubtedly to the extraordinary vagaries of the weather during the past winter, the Royal Horticultural Society's Hall in Vincent Square was not quite so well filled with exhibits as is usual at the Spring Show, held on Friday, April 19th.

However, the quality of the blooms was, in many cases, very superior, and the Polyanthas, which were very much in evidence, and which are rapidly coming to the front as decorative plants, were very generally and very well shown.

One noticed particularly the colouring of Locarno, Superba, L'Ideal, La Reine Elisabeth, and Golden Salmon, the brilliancy of which seemed to be intensified by the intermingling of the variety White Echo. The Polyanthas are easily grown, have a prolonged flowering period, and appear to have a great future before them for decorative purposes. Messrs. Cutbush showed in pots a particularly attractive rectangular group of these, which included a new brick-red Continental variety named Mrs. A. Hudig.

The winning box of that glorious old yellow Rose Maréchal Niel at the N.R.S. Spring Show exhibited by Mr. A. T. Goodwin

Blooms of this Rose were presented to Princess Mary on this occasion

In the class for staged groups of cut blooms, Messrs. Elisha Hicks were awarded first prize for a very fine exhibit, which contained particularly good specimens of Climbing Lady Hillingdon, Climbing Mrs. Herbert Stevens, Souvenir de Claudius Pernet, Charles Shea, and Angele Pernet.

Messrs. Ben. Cant obtained second prize for an artistically arranged group, in which were especially noticeable Mrs. Beatty, Phœbe, and Padre. Messrs. George Prince were awarded third prize. Prominently in their group was displayed Elizabeth Arden, a creamy-white, scented, and full rose.

In the Nurserymen's class for exhibition blooms in boxes, Messrs. Frank Cant were awarded first prize, and their perfect bloom of Dorina Neave (see illustration) received a silver-gilt medal as the best bloom in the Nurserymen's section.

The new Roses exhibited were few in number, and hardly up to the average of excellence. Julien Potin, a full, bright yellow, scented, French Rose, with glossy foliage, was given an Award of Merit. It attracted a good deal of attention, and created a very favourable impression. Messrs. Beckwith showed Polly—rather like Ophelia—and Florex, a fairly full, scented, deep pink Rose. Messrs. Ben. Cant showed Joan Cant, which might be described as a mixture of Gladys Holland and Madame Abel Chatenay. They also showed Mrs. Walter Jones and Daily Sketch. The former of deep orange colour, which appeared to fade easily, and the latter a brilliant piece of red and yellow colouring.

In the Amateur section, Mr. G. A. Hammond was awarded first prize for a staged group of cut bloom. These were of very fine quality, particularly Mabel Morse, Mrs. Foley Hobbs, and Mr. G. A. Hammond. Mr. Hammond also obtained first prize for a box of 12 exhibition blooms (see illustration), one of which—Mrs. Campbell Hall—was awarded a silver-gilt medal for the best bloom in the Amateurs' section.

Mr. J. N. Hart obtained first prize for six good blooms of Mrs. Foley Hobbs, and Mr. H. Oppenheimer first prize for a basket of very fine blooms, artistically arranged, also illustrated.

Mr. T. A. Goodwin again obtained first prize for excellent blooms of Marechal Niel, for which he has become famous.

In the Ladies' classes for Amateurs, Mrs. Courtney Page was awarded first prize, both for dinner table and bowl, and in the open class, Mrs. C. R. May was also awarded first prize for both dinner table and bowl. For the dinner table and bowl the favourite Rose seems to be of the Ophelia type, the long, stiff stems of these being particularly suitable for the purpose. Beautiful specimens of Lady Sylvia being shown. During the morning, Princess Mary thoroughly inspected the various exhibits, and on leaving the Hall, graciously accepted a basket of fine blooms of Marechal Niel, grown by Mr. T. A. Goodwin.

Precautions against insect

It is commonly supposed that a har
ter like the last is of great value in
ing many kinds of injurious pest
growers sometimes look forward
following summer as likely to be
which the work of pest control will
duced to a minimum. That belief
borne out by the facts, and, as an in
we may recall the events of 1917
weather in the early months of that y
very severe, frosts as bad as those of
and February last being experienced.
following summer the position in re
insect pests of farm crops seemed
than usual. South Lancashire and C
suffered from an epidemic of the Whe
Fly, and there was much damage by
throughout the country. Pea and
crops were almost ruined in many c
and there was a definite increase in M
Fly, which in the preceding period o
had been inconspicuous. Roots
much from Cutworms, and White B
caterpillars were unusually abundant
Cabbages. As regards fruit, the
Moth caterpillar was common and
throughout the country, and there wa
complaint of the damage it caused
haps, however, the most outstandin
was an epidemic of Antler Moth cate
in the Peak district—the pests o
literally in armies, which devastat
moorland pastures. On the opposite
the account there is a note in the reco
aphides of all kinds were scarcer tha
and did not do much damage. It is
however, that, on balance, 1917 was
year for insect pests, and while this w
no justification for prophesying that t
will be equally bad, the facts do sugg
strongly that a severe winter should
to any relaxation in the routine m
for dealing with our insect enemies.

THE SPRING SHOW OF THE NATIONAL ROSE SOCIETY

REMINDERS FOR THE WEEK

Southern and Midland

The Christmas Rose (Helleborus niger) and its varieties

The time has arrived when these fine plants may now be safely lifted, divided, and used to form new plantations. Position and soil are important, and this must be carefully considered before preparation begins. On sandy, light soils the back of a south wall or hedge should be chosen, but on cold, heavy soils a greater exposure to sunshine will do no harm. The beds should be deeply trenched and enriched, and must certainly be well drained. As old lime rubble possesses a great attraction for them a generous use of it should be made in heavy soils, or if this is not obtainable chalk should be used. In dividing up the plants great care must be used to avoid damaging the crowns, and the same may equally apply to the fleshy roots. Select clean, healthy pieces—even though small—in preference to large and partly worn out roots, and plant firmly, watering for a time should the weather prove hot and dry.

Border Chrysanthemums

These should now be planted out where they are to bloom, and even though small, growth will at once be cleaner and stronger than has been the case during the last few weeks. These plants resent being coddled up in frames, and never seem to come quite into their own until ready for the open. Pinch down any shoots which show a tendency to run during the next few weeks.

Hardening-off plants

There are many subjects which, though grown on in greenhouses, are hardier than the majority of plants usually employed for bedding, and from this date many such may be stood in the open with a skeleton frame erected over them to support a light covering at night. This will relieve the congestion of the houses considerably, and no time need be lost in carrying it out. These include Hydrangeas in tubs, Lilies of most kinds, Eucalyptus, Grevilleas, Agapanthus, Cannas, Plumbagos, etc.

Arum Lilies

Gradually harden off these plants which have ceased to bloom, but avoid extremes until these have become accustomed to lower temperatures. Continue to feed occasionally with liquid manure, and permit the foliage to ripen gradually. When somewhat hardened they may with advantage be stood in the open, but protected from rough winds.

Gloxinias, Cyclamen, Gesneras, and Achimenes

Those raised from seed will require shifting into larger pots at intervals; there are, however, some seedlings which, for various reasons, do not keep pace with the main batch, and until these show greater activity and roots are plentiful they should remain undisturbed. Those grown from old corms should be encouraged by daily syringings and brisk, moist temperatures.

May-flowering Tulips

As some of the handsome tall varieties are liable to be broken off when in full bloom, light sticks should be placed to support them in advance of their opening.

Tomatoes

All available space should now be utilised for these in houses, where, given reasonable care, a very handsome return will be made, and those intended for planting in the open next month should be grown as hard as possible, preferably in cold frames.

Runner Beans

A sowing may now be made in boxes in gentle warmth. Where the young plants will be through the soil in a few days, no attempt should be made to hurry them, and as soon as two good leaves have formed they may be transferred to cold frames. Such plants will come into bearing at a much earlier date than those sown in the open in May.

Carrots and Beet

The main crops of these may now be sown on warm and well prepared soil, which, previous to the drills having been drawn, has received a free dusting of soot. Ground for these crops should not be enriched with a lot of manure, otherwise large, coarse examples will result.

Vegetable Marrows, Salsafy, and Scorzonera

These may all be sown, the former on specially prepared beds in the open for a late crop, and the remainder in drills 16 inches apart on deeply and well-worked ground. These latter are in considerable demand, but are not grown as often as they should be.

General work

The staking of Peas will require constant attention, as will also the hoeing of all young crops, which derive immense benefit from this stirring of the surface. Various crops of Salads, Spinach, Turnips, etc., must be thinned when large enough to handle, and others sown to maintain a supply.

E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Sow Wallflowers now

To secure really fine bushy plants it is necessary here, in the north, to sow about this time. But the Siberian variety, Cheiranthus Allionii, is an exception, as, sown early, it invariably begins to bloom in autumn, and is thus spoiled for a spring display. Sow in shallow drills, and prick off into nursery lines when the seedlings are 4 inches high, transferring them to flowering quarters in autumn. Myosotis, Campanula pyramidalis, Agrostemma, and Canterbury Bells should all be sown in boxes of light soil, and then set in a cool greenhouse or frame. They can, of course, be also sown in the open, but are really more trouble when this is done. When raised in pans or boxes, the pricking off may be carried out during bad weather, and time saved, while the plants, as a rule, are larger and better than those raised in the open gardens.

Pansies and Violas

The planting of these should now be pushed on. Planted now, the plants have less risk of damage by slugs and snails, and, as a rule, grow away quickly, whereas those put out early are often crippled, either by vermin or the weather.

Border Chrysanthemums

If the plants have been well hardened off, as advised recently, and the weather is fairly genial, a start can now be made to plant them in their flowering positions. Good, but not unduly rich, soil suits this plant best. When heavily manured, growth is soft and rank, and any flowers that do appear are of poor quality.

The planting of Sweet Peas

This work may now be proceeded should the weather be favourable an ground in good condition. I have never able to see the advantage of early pla Early May, as a rule, gives excellent re

Trim Box edges

Few things are more objectionable garden than over-grown or uneven edges, so it is advisable to trim these every spring. It is a disagreeable, breaking job, but if attended to annual much more easily done. With a little pra any handy man will soon get into the of doing it tidily, and be able to cover a long stretch in the course of a day. cleaning up is as bad and troublesome clipping, and also requires to be pr done.

New Strawberry beds

If these were planted in spring, the must not be allowed to fruit this year flower-stems as they rise must be nippe while runners, too, unless it is desir obtain fresh plants in autumn, should be removed at frequent intervals. Wel the ground between the plants frequ and so induce sturdy, healthy growth.

Fruit bushes

Very considerable benefit results frequently hoeing the ground betwee Currant, Gooseberry, and Raspberry b while weeds are kept down and the qu look smart and tidy.

Vegetable crops

Another sowing of Peas will be abo again, good varieties for present use Superlative, Commonwealth, and Salute. More Spinach, Lettuce, Radish Turnip should also be got in accordi requirements. If not yet finished, the ing of Potatoes should proceed as fa possible. Keep the hoe at work a young vegetables of all kinds.

Cinerarias

Prick off the seedlings into boxes as as large enough to handle. Keep well s from the sun, and do not over- especially at first. A further batch m sown and brought on as coolly as possi

Primula malacoides

Seeds of this charming little Primros now be sown and given cool treat Damp is its greatest foe, so watering always be carefully attended to.

Cyclamens

Old bulbs that are intended to be gro again must have a little attention. chuck the pots under the greenhouse as is so often done, but take them to a cold frame, attend them well with until the foliage begins to look like ri off, when water should be given sparingly until growth begins to be more noticeable. Enough should th given to get the growth to spring strongly and healthily.

Dahlias

The later batches of cuttings will, f most part, have been placed singly in while the earlier lot will doubtless be for removal to cooler quarters—in case, a cold frame, where they will r to be well matted over at night in cas should suddenly descend on us, as it does at this season C. B

munications made to the Congress by of papers, or participation in the l discussion, will be permissible in h, French, and German.

correspondence should be addressed to ecretary of the Royal Horticultural y, London, S.W.1.

erbaceous Calceolaria

plants will now be showing for , so a little gentle feeding will prove ial. Keep Green Fly in check by rising occasionally. Seeds may still wn to provide plants for next year's ly.

Answers to Queries

Questions—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent each should be on a separate piece of paper, the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*All who wish their plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

FLOWER GARDEN

Lilium tigrinum and lime

I was much obliged by your kind reply *re* Anemone pulsatilla Mme. Van der Elst, and, of course, if it likes peat it hated *us*—all lime. Will you now tell me why can I not grow Lilium tigrinum either in the native soil (limy, stony, very well drained) or in any made bed? Liliums regale, auratum, Martagon, Martagon album, candidum, chalcedonicum, Willmottiæ, Formosanum (hardy form), testaceum, even Farreri (though, of course, it spends all its time walking round, and only flowers occasionally) all thrive. But no kind of a Tiger Lily comes up after the second year. What is it they want? Lilium speciosum, too, is not altogether happy, but it keeps alive, and produces rather malformed flowers every year. We give it peat. M. L. W.

Bath.

From Gardening Illustrated

Fifty Years Ago

Persian Cyclamens

IN raising seedlings of these bright greenhouse flowers, my chief aim is to produce flowers of rich and distinct colours, with good shape and substance, good foliage, and especially plants with a good habit. I cross only my very choicest varieties on the above principles, and recommend not more than three or four blooms for seed on each plant, and for this reason each bloom when crossed will produce, putting aside accident, a pod containing from 30 to 60 or more seeds. . . I cross each bloom carefully, if I want colour, with two blooms of separate plants of the best colour and shape I can find, and so with each, for I find you can vary the flower very much. . . I can scarcely praise the value of Cyclamens too much, for whilst growing, and previous to blooming, they are handsome foliaged plants, and in this stage, as well as when in bloom, they are admirable for table decoration. They commence blooming in September and October, and continue, if not forced in heat, until April and May. . . H. L.

[This is a Lily which very much resents the presence of lime in the soil. To grow it in your soil you should prepare pockets of good fibrous loam, lime free, with a liberal admixture of sand and well-decayed leaf-soil. The reason why this Lily and speciosum do not do well in your made beds is that you are probably giving them peat in the true meaning of the term. That is, bog peat, which is generally unaerated and acid. All Lilies love leaf-soil, but a great many detest peat. If you make up your soil with plenty of well-decayed leaf-mould in the place of peat you will probably have much better success. Good drainage is, of course, essential. Only use the bog peat for the Swamp Lilies of North America.]

Unhealthy Primrose plant

(S. M. M.).—(1) The enclosed plant is suffering from an attack of wireworm, several of which were still alive among the roots. This would account for the condition of the others you mention. Lift all the plants after flowering, wash every particle of soil from their roots, and replant on fresh ground which has received a dressing of Vaporite or other soil fumigant, and your plants will, in all probability, regain their former vigour. For the new plantation use from the healthy plants only and destroy those of a yellow appearance at once. (2) We believe the double-flowered Primrose to be Burgundy, not Arthur Dumollin.

Lilium speciosum

(O. M. Goens, U.S.A.).—These bulbs may be moved now, provided that there is no growth showing above the ground. If they have already made growth, even a few inches, they should on no account be disturbed until late autumn. These Lilies dislike lime, though they tolerate a certain small amount in the soil. It is not advisable to mulch the top of the bed with animal manure. Good, well-rotted leaf-mould is far better. A little well-rotted animal manure may, however, be placed advantageously a few inches *below* the bulbs where the basal roots can reach down into it.

Bulbs after flowering

Could you kindly tell me the best time to dig up Crocus and Narcissus bulbs and how they should be treated before planting out again? "HARRIETSHAM."

[As soon as the foliage gets brown the bulbs of both may be lifted (in the case of the Daffodils *must* be lifted), laid in shallow boxes, and set in a dry, open shed to dry. When thoroughly dry grade the bulbs, the largest for pot culture (if desired), the second size for replanting, and the small either for planting in the reserve garden or in grass, where they will flourish and eventually flower. As the Daffodil takes practically no rest it is well to plant these in August or September, but the Crocuses may be left over until October. If the largest bulbs are not required for pot culture they will, of course, be ideal for planting in the garden.]

Heuchera not flowering

I have a few plants of Heuchera sanguinea which I cannot get to bloom freely. I have tried lifting and dividing, also enriching the soil without success. They are growing in a sunny border in fairly light soil containing lime in the form of mortar-rubble. The plants are growing freely and in a healthy condition. Can you advise me as to what methods to adopt to get them to flower? "SCOTTISH GARDENER."

[This plant is, proverbially, a shy bloomer. You seem to have given it quite orthodox treatment, so we can only conclude that, as in so many other gardens, the soil does not really suit this Heuchera. It is really in few gardens that it blooms at all well. The late Mr. James Mayne, in his garden at Eltham, found it to thrive and bloom splendidly. He very kindly sent us some cuttings a year or two ago, but, notwithstanding the special care lavished on them, have scarcely ever bloomed. You would be well advised to cultivate H. brizoides or H. Pink Profusion instead of H. sanguinea, as these bloom profusely every year and have pretty coral-pink flowers on fine, wiry stems, and they are ideal for cutting, as well as for garden adornment.]

Clumps of Pampas grass

(" Awbridge ").—The flower-stems may be cut back and the plants given a generous mulch of well-rotted manure all round the roots, this being all that is necessary. Dead foliage, too, of course, can be removed.

GREENHOUSE

Pelargonium foliage

(Me).—The marking on your Pelargonium leaves sent for examination is due to White Fly (Aleurodes vaporariorum). These creatures live by piercing the foliage and sucking out the juices of the plants, and in many cases the piercing is followed by spotted foliage. We should advise you to take steps to clear up the White Fly by fumigating the house with frequent doses of calcium cyanide or a White Fly fumigant. Details of both materials appear frequently in our advertisement columns. If you have any difficulty in applying either fumigant write us again. The vendors of the materials mentioned will give you full details for application, but you must be careful, because you say that " The house contains many kinds of plants " and some plants are injured by these fumigants.

Lapageria leaf

(" Queenie ").—By the appearance of the leaf sent we should say that the plant has had a severe attack of Red Spider, caused by lack of moisture both at the root and in the atmosphere of the house. It may also have been subjected to too much heat. With judicious attention it will, doubtless, recover, but will take some time to do so. You should spray frequently with some approved insecticide, making certain that the undersides of the leaves are thoroughly wetted with the spraying liquid.

TREES AND SHRUBS

Acacias

(O. M. G., U.S.A.).—The reason these have not bloomed is probably because they are not yet large enough. If you grow them on until they are about 4 feet high you will find they produce bloom fairly freely, increasing in freedom of bloom as they get larger. They will do well in any average good garden soil.

Pruning Ceanothus

Three very fine shrubs of Ceanothus are trained against the wall of the house facing due south. They were badly caught by the frost (22 degs.) in February, and it was feared they were dead, but in the last 10 days they have all begun to put out tiny shoots. They are generally pruned after flowering in April or May, but as there is no question of flowering this year will it be best to leave the dead wood as a protection for the young shoots and avoid further strain on the tree or prune hard back and cut away all dead growth?
B.

[We recommend that all the dead wood should now be cut clean away.]

Climbers for a north wall

(H. H. M.).—Late Dutch Honeysuckle might be tried, but such a position is hardly suitable for white Jessamine. The following would prove satisfactory:—Climbers: Rose Bouquet d'Or, Mme. Isaac Perriere, Wistaria sinensis, Ceanothus, Gloire de Versailles, Clematis montana grandiflora and C. m. rubens, Jasminum nudiflorum. Shrubs: Cotoneaster Simonsii, C. horizontalis, Lilac Souv. de Louis Spath and Mme. Lemoine, Rose Fellemberg, Rhododendrons and Azaleas if your soil is not calcareous, Forsythia spectabilis, Berberis Darwini, B. subcauliata, Skimmia japonica var. fragrans, Daphne Mezereum, and Aucuba japonica and Pyrus japonica.

Creamy white Clematis

(Solace).—The variety you refer to is most probably Clematis Henryi, a magnificent creamy-white flower. We have never before heard the name " Hiawatha " applied to a Clematis. Are you quite sure your friend gave the name correct, as no such plant is listed so far as we have been able to trace, either by our own or Continental nurserymen?

Wistaria not flowering

Can you give me any reason why Wistaria sinensis does not flower? It is situated on the south side of the house and has been planted five years. It has made huge growth which has been stopped from time to time, but so far not a single bloom has been seen.
" LYNTON."

[It looks as if you have planted your Wistaria in too rich soil. This plant, while it demands a fairly good loam mixed with leaf-mould, is apt to run to wood and leaf if too generously dealt with. A good method for inducing the formation of flower-buds is to prune side shoots during summer in much the same way as fruit trees on walls are treated, while in winter these side shoots are again somewhat shortened.]

Thuya Lobbi dying

(F. G. Rydon).—It is difficult to account for your trouble unless the trees have been damaged by frost, and even if this is so, it is unusual. Is there any possibility of them having had any destructive liquid poured about their roots or over their foliage? All you can do is to cut away the damaged growth—even though this may entail cutting them to within 4 inches or 5 inches of the central stem. They will then shoot out again if alive, and in time make fast growth. If you find they are really dead to the base, then we advise you to renew them without delay as there is yet time to do so before the end of the month.

Tricuspidaria

Can you give me some idea of what the evergreen shrub Tricuspidaria is like, and under what conditions it is likely to succeed?
EMILY M. BURN.

[The Tricuspidaria is only half-hardy and is usually cultivated as a cool greenhouse shrub. It has flowered out of doors at Castlewellan, Co. Down, Ireland, for several years, and appears to be quite hardy there, also in Cornwall and other favoured parts. It flowers twice a year, the blooms being of a brilliant crimson colour. This plant thrives best in a compost of equal parts peat, loam, and leaf-mould, with enough coarse sand to ensure porosity.]

ROSES

Rose canker

(Robinet.)—Your Roses are affected with Stem Canker (Coniothyrium fuckelii). This fungus often causes trouble amongst R
The disease commences on the young w
and does not affect the foliage. Spores
produced from the diseased patches, and t
serve to set up the disease in new areas.
should cut out and burn all the infected w
repeat as often as is necessary to ol
control.

FRUIT

Mulching Peaches

Is it advisable to mulch a " F
George " Peach tree with cow manure
is grown in a cold house, and is abo
years old.
" LYNTON

[If the tree is not making unduly st
wood, a mulch of cow manure would be
ficial, but should the shoots be very
this material must not be used.]

VEGETABLES

Tree Tomato

(New Reader).—The Tree Tomato i
tremely prone to that pest White Fly
roots freely from cuttings at this period.

Vegetables under paper

I have recently seen a report upon pla
various vegetables etc. under paper,
French magazine " Je sais Tout." I
to know whether this method of planti
known in England, and if so where the
can be obtained and any details rega
the method of using it. Should it be n
you I shall be glad to send you a copy
article, translated from the French.
CHAS. P. HAY

[We have no record of this paper h
been used in England. We should like
the article quoted in your letter. Pe
some of our readers have used the pap
so, may we ask for their observations?

MISCELLANEOUS

Moss on lawn

(Georgiana C. Dillon).—Bad drainag
poverty of the soil are the chief causes
trouble. Temporary relief may be h
tearing up the Moss with a new stee
and then dressing the lawn with on
lime to four parts loam, the whole
spread evenly over the surface after
riddled and well mixed. A little ar
manure may also be given. We hav
known of good results following the
dry wood-ashes applied liberally as
dressing. In any case roll the law
after either of these top-dressings hav
applied. Next winter it would be ad
to have the lawn properly drained.

Moonlight

Please could you tell me what eff
any, moonlight has on plant growth
where I could find an account of experi
to ascertain its effect?

[We are publishing your letter in th
that some of our readers may be a
assist you.]

Artificial manures

(Suburban).—Plants require from th
certain chemical elements, and of the
ments it is always necessary to replac
chemicals which, for various reason
likely to be in short supply. The ele
other than these four are, under mos
ditions, present in sufficient quantit

stration).

Billbergia nutans (nodding)

A greenhouse or window plant that is frequently sent to this office for naming. Native of Brazil, 1868. The sepals are reddish, petals green, both with a blue margin

Early vegetables

RE are many frames occupied just
with early raised vegetables which
uld be well hardened off before being
fully to air and sun. Too frequently
rs plant them out in the open, no
whether they are fit to withstand the
ange of temperature or not, with the
hat the check they receive so cripples
at they seldom get over it. Vegeta-
quite hardy if grown under normal
ins, but when raised in a warm house
e, they are as tender as hothouse
therefore, if taken out of such
es and at once exposed to cold
he result is disaster. If the weather
be cold, with dry winds, do not be in
to get the plants out. If there

ient size and depth to take the plants
e leaves. Press the soil around them
and if the weather is dull, with
e, no further care is required, except
al against slugs and other vermin.
ns raised under glass will require care
roots go down deep, and when lifted
le to injury unless they have been
which is by far the best system.
r, if they are in boxes, insert the
at one end of the box, so as to get
it well beneath the roots, and so lift them with the mimimum of injury. Planting should always be done with the trowel, as then holes can be made that will take the roots full length. At the same time, guard against too deep planting, as this will tend to "thick neck" or stout stems instead of bulbs. As soon as they become established, onions require ample support in the way of feeding. If the plants are lifted without balls of earth attached it may be necessary, if there is bright sun, to shade them, but it is well to remember that the less shade given the more sturdy will be the plants.

Many Peas are sown in pots and boxes, which may now be planted out with every chance of success. To obtain the best results give every Pea a space of 4 inches. A trench should be taken out deep enough for the roots to be inserted without twisting.

All Peas require a rich, deeply-cultivated soil, and it is as well to remember to give the tall-growing varieties plenty of moisture to obtain the finest results. When planting has been completed and the weather becomes dry, a nice sprinkling with a fine rose can is beneficial, but there must be no heavy watering as this will lower the temperature of the soil. When fully established and growing strong, more liberal watering will be required if the weather is dry.

A most important thing with all newly-planted things is to keep the surface soil loose by the frequent use of the hoe. Not only does it keep down weeds, but it assists in promoting strong and healthy growth.

No watering should be done in the evening at this time of year, for it not only makes the soil could through the night, but it brings out the slugs and snails. F. H.

Vegetables to make up for losses

An inspection of some ten acres of allotments enables one to realise the wholesale slaughter of all green vegetables. I have seen nothing like it since February, 1895. Of the thousands of Broccoli put out hardly one is left, only a few autumn-planted cabbage, possibly about one in twenty, and even the hardiest Kales are badly cut. Asparagus Kale, and similar broad-leaved varieties seem to have suffered more than the dwarf curled sorts. That being so, it will be well to give the reminder that it will be advisable to set to work promptly and sow several things that can be relied on to come along quickly and compensate for above failures. Deans early Snowball Cauliflower should be one of the first choices. It does its work very quickly, and being dwarf and very compact can be planted at 18 inches each way, and so a capital cutting is obtainable from quite a small area. A pinch of a quick turning-in Cabbage as Flowery Spring may be sown to fill up the gaps in the autumn, planted big. Autumn-sown broad Beans are also badly cut up; the best sort to sow now to come in quickly is Beck's Dwarf Green Gem, especially for small gardens. It is not easily obtainable, and missing from many catalogues, but an old favourite of mine, as I have found it acceptable to those who object to a strong flavouring Bean. It comes in very quickly, and for its height is a grand cropper. A sowing of French Beans can be made on a warm border if provision is available for protection in the case of spring frost. A row or two of Spinach is also likely to prove acceptable, as there is very little left of the autumn-sown crop, also an early Lettuce of the Tom Thumb type. In a season like this one has to be thankful for good crops of all kinds of root vegetables, including potatoes, otherwise we should have to wait a long time before there was much variety in our vegetable cooking. I am writing of gardens like my own where we have to rely solely on outside work, and there is no glass either to grow crops inside or bring things along for outside planting. E. BURRELL.

Hardwick.

Marketing of Cornish Broccoli on the Continent

Up to about three years ago the Broccoli produced in Cornwall was grown from local seed and did not produce the firm, white curds which the market so desires. Seed of superior strains was obtained through the agency of the Ministry of Agriculture, and Cornish Broccoli graded up in quality. A deputation of growers of Cornwall, with the County Horticultural Superintendent, visited the Continent in January last to see into the possibilities of marketing Broccoli at the more important centres there. As a result, they came back determined to try sale on the Continent, to grade and pack it, and incidentally to get permission from the Ministry to use the National Mark on it. The Ministry agreed and made regulations prescribing grades and marks, the whole organisation and arrangement being agreed with the Cornwall Branch of the National Farmers' Union and the County Horticultural Superintendent. Seven growers applied for permission to use the Mark, and consignments were despatched to Brussels and Cologne.

Studley College for Women

Studley College, in Warwickshire, represents a pioneer effort in the education of women in agriculture in this country. The Governors, with the approval of the Ministry of Agriculture, are endeavouring to buy the College, and the Treasury has promised a grant on a £ for £ basis up to £5,000. A fund has been formed, to which subscriptions are invited. In connection with it a show and sale of flowers, fruit, vegetables, and dairy produce was opened by H.R.H. Princess Mary on Thursday, April 25th, at the Horticultural Hall, Westminster.

The importance of the part played by women in agriculture is not always fully realised. Out of about 800,000 workers, 100,000 are women and girls, and there are in addition to these about 20,000 women running farms and small holdings on their own account. The hard times through which agriculture is now passing have caused most people to realise the importance of sound technical training, and Studley College supplies this at present to some 60 students, and would supply it to more if its financial position allowed. The College, though self-supporting, has no endowment and no reserve fund, and to provide these and to purchase the premises the Governors are asking the public to support their efforts. Apart from the point of patronage of the show at the Horticultural Hall, Westminster, on April 25th, those who are able to support the Fund directly are invited to do so by sending contributions to the Honorary Secretary of the Studley College Fund, at 26, Eccleston Street, S.W. 1.

Norfolk and Norwich Horticultural Society

Spring flower show

This is the centenary year of this old Society, having held its first exhibition in 1829. It was, therefore, very encouraging to find that the entries upon this occasion exceeded the average of the past five years; indeed, they reached pre-war numbers. Narcissi, owing to the extreme cold weather, were not quite so long in the stem as usual, and one also noticed that several of those which are usually over before the show date were at their best this year.

Captain A. Sandys-Winsch, the Secretary, won the cup for 24 varieties of Narcissi and Daffodils, distinct. As this is the third win it now becomes his own property. This grower is making great strides in the raising of seedlings, and many on his stand under "numbers" foretold of a demand for them when they are put into commerce.

Colonel H. G. Barclay (gardener, Mr. W. C. Barrie) also had an exceptionally good lot of quite up-to-date named kinds. The smaller classes, especially the Trumpet section, were very attractive, many new kinds and seedlings being included in them.

Vases, baskets, and other decorative classes were all well contested.

General cut flowers.—In this section Carnations were predominant. Colonel Barclay had far away the best.

In the classes for greenhouse flowers, hardy flowers, and hardy outside-grown flowering shrubs Mr. Sam High, gardener to J. A. Christie, Esq., M.P., Framingham, took three firsts. A tit-bit in his hardy flowers was a vase of the bright-coloured Tulipa protescens, and of the flowering shrubs Magnolia Kobus and Osmanthus Delavayi were outstanding. Violets from Mr. F. J. Endersby, gardener to Gerald Gurney, Esq., Keswick Hall, Norwich, were a meritorious feature.

Pot plants.—These are always good. The splendid collection on a table space 8 feet by 3 feet exhibited by Mrs. H. J. Copeman, 111, Newmarket Road, Norwich, were exceptionally well grown, and embodied Calceolarias, Schizanthus, Primulas, Cinerarias, etc., literally sheets of bloom. Great credit was due for this exhibit to Mr. Mitchell, the gardener.

Mr. Ernest Bond, Newmarket Road, also had a fine group, and, besides this, took prizes for Cinerarias and other pot plants.

Cyclamen were in profusion, wonderful plants being staged by Colonel H. G. Barclay and Mr. Gerald Gurney.

Fruit and vegetables.—These were not a strong feature.

The Trade gave of its best and helped as much as anyone to make the show of educational worth. Messrs. Daniels Bros., Ltd., Norwich, had bulbous flowers in great varieties, early forced Irises being an outstanding feature, as also were their many-coloured Freesias. Allens, of Norwich, had a beautiful display of forced Roses, so also had Messrs. A. Reeves and Co., Old Catton, Norwich. Allwood Bros., and C. Engelmann, Ltd., both had effective displays of Carnations. Bakers, of Wolverhampton, had rock plants in great variety. Miller, Wisbech, had hardy flowers and rock plants. R. Winder, Ltd., also had a good display of forced shrubs and rock plants. Without doubt the pick of the trade section were Bath's Daffodils, some priced at £40 per bulb; how they made one wish for the purse of a millionaire.

Though not a trade exhibit we must specially mention the collection of Roses in pots put up by an enthusiastic amateur, Dr. G. E. Deacon, Brundall. They richly deserved the Gold Medal which the judges awarded.

Aytch Pea.

Trees of remembrance

With the approval of the Roads Beautifying Association, the Roads of Remembrance Committee are appealing to the public to co-operate with them in planting trees in commemoration of those who fell in the Great War, or of any outstanding event in our public or private lives; of the visits of any prominent persons to our country; of occasions of national rejoicing or mourning, and of births, marriages, or deaths in our own families.

Those to whom this is of interest may like to know what can be done through this Committee for planting either single trees, or a number of trees to form an avenue or group.

(1) By arrangement with the Surrey County Council with whom the Roads Beautifying Association are collaborating in roadside planting, certain trees can be allotted on the Kingston By-Pass for Remembrance purposes, according to the wishes of the donor.

(2) Should members of the public wish to plant trees on any other road than that mentioned, if such roads are suitable for this purpose (that is to say with a sufficiently wide margin at the side), the Roads Beautifying Association will approach the highway authorities concerned, and request permission for the planting of such trees.

The Roads of Remembrance Committee of the Roads Beautifying Association would arrange for the preparation of the ground, the provision, planting, and staking of the tree and the fixing of a permanent tablet, for the inclusive sum of two guineas per tree.

A list of trees herewith are suggested as suitable, but many other varieties may be planted if specially desired.

TREES FOR THE WAYSIDE.

Trees.

Acer dasycarpum, platanoides (Norway Maple), platanoides Schwedleri, Pseudoplatanus (Sycamore), Pseudopl. purpureum, Pseudopl. brilliantis rubrum (Red Maple).

Spraying fruit trees in open blos

The danger in spraying fruit trees open blossom with washes co arsenate of lead is that visiting bees killed. The lead arsenate washes tainly of great value in extermina Winter Moths, the larvæ of which siderable damage to the trees, but th ing should be done either just be blossoms open or immediately a petals have fallen. There may be so difficulty in arranging this in big c as, of course, the different varieties come into blossom at different time it should be aimed at, and certain should be no indiscriminate spraying blossom with lead arsenate. If a are noticed where bees die in nur such circumstances as are descri should be reported to the Ministry culture.

ANTIRRHINUMS

The Cheapest and Best Bedding Plants obtainable

The best effects are obtained by planting in masses, whilst beds of special colours may be planted according to the colour scheme decided upon, and in borders the tall varieties should be planted at the back, following on with the intermediate kinds, and edged with the dwarf and Tom Thumb varieties.

TALL VARIETIES, growing about 2 to 3 ft.

Bonfire—Bright cinnabar-red, yellow blotch
Cerise King—Rich cerise-pink, white throat
Cottage Maid—Very handsome pale pink, white throat
Crimson King—Beautiful rich crimson, very fine flowers
Orange Beauty—Orange-scarlet, gold tipped
Queen Victoria—Large white
Rose Dore—Self salmon-rose, shaded gold
Yellow King (Majus)—Deep golden-yellow

INTERMEDIATE VARIETIES, growing about 1 to 1½ ft.

Black Prince—Intense crimson
Bonfire—A beautiful orange and flame colour
Canary Bird—Pale shade of pleasing yellow
Carmine Queen—Rich rose-carmine
Cottage Maid—Pale coral-pink, white throat
Daphne—Coral-rose, white throat
Fascination—Deep flesh pink
Golden Monarch—Golden yellow
Golden Queen—Deep yellow
Morning Glow—Terra-cotta, orange
Nelrose—Deep rose-pink, very popular
Scarlet King—Rich scarlet, fine
The Beacon—Beautiful salmon hue
Vesuvius—Deep vivid orange or flame colour
White Queen—The finest white bedding variety

DWARF VARIETIES, growing about 6 ins. high.

Apricot Queen—Apricot
Brilliant Crimson—Rich crimson
Delicate Pink—Shell pink
Orange Scarlet—Rich orange-scarlet
Rose Queen—Rose
Snowflake—Good white variety

Very suitable for edging.

The plants offered are hardily grown, and can be successfully planted from March to June. We have retarded plants for later planting.

Prices—Single dozen, **2/-**; per 100, **10/-**; per 1,000, **90/-**.

Carriage paid, packing free, for cash with order. **Nurseries 130 acres.** Late Cranston's

Where can I obtain?

THE difficulty of not knowing exactly where you can secure some special line needed for the garden — probably recommended or seen elsewhere—is easily overcome by utilising the services of "G.I."

Considerable care over a number of years has been given to tabulating information on all aspects of gardening that shall prove of assistance to our readers.

Write us, therefore, when you want to know where to obtain any seeds, plants, shrubs, horticultural implements, sundries, or other accessories to the garden that you do not see advertised in our pages.

Address your enquiry, with stamped envelope for reply, to—

LAWNS Require Attention—NOW

NOW is the time to feed your lawns in preparation for the summer months. A reliable complete fertilizer will quickly create dense turf. Moss, clover, and weeds should be eradicated now by applying Fisons' Lawn Sand.

Fisons' Technical Bureau is maintained for the benefit of enquirers, without obligation.

FISONS'
LAWN GUANO
(A Compound Fertilizer)

The safest dressing for turf. It feeds the turf over a long period and will not burn or discolour the grass. Lawn Guano quickly strengthens the roots and encourages a dense growth of fine grass. As used by important clubs and municipalities. Apply now at the rate of 4 ozs. to the sq. yd., or 1 cwt. for a regulation doubles tennis court.

Prices, in Bags:	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**5/-**	**9/-**	**15/-**	**25/-**

FISONS'
GRASS SEEDS

are the finest procurable, being specially tested before selection. Special Mixture (for Bowling and Golf Greens, finest grasses only).

Prices, in Bags:	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**15/6**	**30/-**	**58/-**	**110/-**	**210/-**

FISONS'
LAWN SAND

The most effective preparation for destroying clover, moss, and small weeds, and so doing stimulating the grass. A thimbleful destroys a large weed, such a plantain. Should be applied now at the rate of 4 ozs. to the sq. yd., or 1 cwt. fo regulation doubles tennis court. Measure and full instructions sent.

Prices, in Kegs:	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**5/-**	**9/-**	**16/-**	**27/6**

FISONS' POWDER
WORM KILLER

Is most effective against worms and is safer and cheaper than other preparatio It is convenient to use and a forced jet of water is unnecessary. Apply 4 ozs. to sq. yd. or 1 cwt. to a regulation doubles tennis court. Full instructions sent.

Roses: Afterthoughts of the Spring Rose Show

RE is something very satisfactory he visit to a show when one can back and enjoy what one saw. At nt Rose Show an unusual number collected around one table attracted tion. At first I thought some new Rose must be the cause, but soon two lovely exhibits of yellow Roses—chal Niel and Mrs. Beatty—in com- and Maréchal Niel won. I thought most perfect blooms in the show— d others. Their agrance and lour remain as y recollection. 10 cannot grow bing Maréchal ould try Mrs. a bush variety very similar in and nice bushy

now itself con- more Lady Mme. Butterfly, selandia than r varieties, and lee are the best Roses that They are the rst easily grown y the amateur, y be supple- by Richmond, Beauty, and for crimsons. delightfully n when forced ass.

een rosarian, ils to have the ew Rose of was naturally d by Julian which received icate of merit. rilliant yellow, my opinion to all those of e of Florence Mabel Morse, and Souvenir de Pernet shade, while it is infinitely than Mrs. Wemyss Quin. This alone th going to the show to make its ance.

ay expect every Rose to have a fault, rm, size, colour, scent, as well as plant, I rather fancy Julian Potin ss.

Courtney Page's dinner table of the ellow Roselandia was an exhibit as perfect. No wonder one felt a grow Roses in spring at the sight One may have these spring Roses, too, with little more trouble than given to Chrysanthemums, except for the warmth required to force them.

Those who like bright colour can find it in Chas. P. Kilham, another Rose well shown, with bright orange apricot centre and carmine pink outer petals. The variety forces well and is superior to Padre in every respect. This Rose was another good thing to remember.

With Roses, as with so many plants these days, we have too many varieties, yet not enough good ones, and we still want more good crimson Hybrid Teas, for how few there are without serious faults. Take the two most ideal of crimsons, Etoile de Hollande and Bedford Crimson, neither of these are really good forcing varieties, and I did not see a flower of them at the show, although I looked around wistfully for them.

Dwarf Polyantha Roses are now in the sun of popular favour. So numerous are they that one can no longer remember them. We can be emphatic, however, that the new variety Sunshine is the best of the yellows. Of the others, Orleans Rose appeals to me as still the best all-round in the rose shade, Mrs. Cutbush the best pale pink, and both of these are old. Kershaw Poulsen is an excellent full double flower of deep rose shade, and Elsie Poulsen the best single dwarf Polyantha that we have. Orange King is probably the best in this colour, and Golden Salmon is effective, but not quite constant. Of the reds no one seems to know the best, and they all have faults, although the majority force well, as do all of the names I have mentioned. Very pretty and long lasting flowering plants they make, as good in the conservatory as in the open.

A. Swallow.

April Roses

The soft golden yellow Roselandia—a sport from Golden Ophelia—arranged with the young foliage of cut-leaved Maples

Schizopetalon Walkeri

This beautiful little annual, better known as the Lace Flower, deserves to be grown more than it is. Being a native of Chili, it is not fully hardy, and as its roots are very delicate, it greatly objects to being transplanted. It has a most beautiful and attractive flower; the growth, which is slender, attains the height of about 1½ feet, ending in a long stem of pure white flowers. The blooms are of unusual shape, being quite square, and resemble a small piece of lace, while the flowers are Almond scented. During the day the flowers remain closely coiled up, but in the evening they expand, filling the air with their scent. The seed should be sown in May where the plants are to flower, but earlier results may be obtained in the cool greenhouse in pots. The soil in the open must be raked quite fine, the seeds sown thinly, and covered with only a mere dust of soil. Select a warm, sunny position, and thin the plants to quite 6 inches apart.

By following the above suggestions for its cultivation growers of this delightful plant will have little to complain of in results under normal conditions.

F. H.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Narcissus moschatus

ONE of the most charming Daffodils for the rock garden is Narcissus moschatus of Haworth, which has for its popular name "the snowy-white Daffodil of the Pyrenees." It is in flower with me as I write (April 24th), after having been in bloom for some time.

Like other flowers here, it is much later than usual this year, but it is very welcome and is a distinct ornament to the position it occupies. It has been planted on a terrace in front of a sandstone boulder, in a crevice of which grows a good plant of that old white Primula known as P. pubescens alba, for which other white Primulas have been grown (Farrer goes fully into the question of this and other white Primulas, but that point is beyond the scope of this note). On first opening, N. moschatus was quite a creamy-white, which looked dull compared with the purity of the Primula. But as days passed on, this "snowy-white Daffodil of the Pyrenees" justified its name, and the lovely little drooping flowers became of the greatest purity. It is rather variable in size, but all the plants give us lovely little flowers on 6-inch stems that always associate admirably with other flowers of the choicer parts of the rock garden. It is recommended for naturalising in grass and for the rock garden, but I have not tried it in the former.

S. ARNOTT.

Anemone Pulsatilla

A few years ago I sent to a nursery for some roots of the above-named Anemone, which is one of our most charming and uncommon early-flowering plants. For many years I lived within a tramp of the chalk downs on which they grew, and each year about Easter we made a pilgrimage to find the Pasque Flowers in bloom.

This year one of the plants I obtained from the nursery under the name of A. Pulsatilla has flowered profusely, but the blossoms are considerably larger and a lighter colour than any that I have ever found growing wild, and they are borne on stems nearly a foot high. The plants are growing on a sunny slope in chalky soil, with good drainage, but not rich. Mr. W. Robinson, in "The English Flower Garden," writes as having found them in the *woods* of Normandy, and as our native variety is, I believe, never found in woods or a shady position, but always on the steep slopes of chalk down, I think it may be possible that I received a variety which is not a native of England, and should be glad to know if the larger and lighter-flowered variety described has a distinctive name. It possesses the characteristic silvery down-like covering on the stems and buds which add so much to its beauty. The purple stigma stands out distinctly in the centre of the rich yellow stamens.

H. H. WARNER.

Balsams

I read with pleasure the note from "Leahurst" in the issue of April 20th (page 265) concerning the Balsam. From a decorative point of view few things are so attractive in greenhouse or conservatory as a well-grown group of Balsams, but, as the writer correctly states, the family has lost caste because it does not fulfil the modern requirement demanded from almost every plant—that of being suitable for cutting purposes. Nevertheless, Balsams are well worthy of attention, and, by successional sowings, batches may be had in bloom from late spring until autumn is well advanced. Those who do not estimate the value of a handsome and symmetrical plant entirely from a "cutting" point of view might do worse than give a little attention to the Balsam. In the category of plants which, like this, are not popular nowadays may be included the Celosia family—C. pyramidalis, C. plumosa, and C. cristata. The latter is, of course, the Cockscomb which, years ago, was such a favourite with exhibitors, while the other forms, with their vivid crimson, scarlet, and yellow plumes, used to focus the attention of visitors to houses in which Celosias were grown. It may interest "Leahurst" to learn that I yet devote some attention to Balsams and to Celosias. Perhaps, to some extent, this is a matter of sentiment, because in the gardens in which I served my apprenticeship both were grown, and grown well, and I have never lost my liking for them. I may add, too, that (although I have made but few changes) the Balsam and the Celosia have been appreciated wherever I have gone.

A SCOTTISH GARDENER.

Narcissus moschatus of Haworth

The snowy-white Daffodil that grows in the Spanish Pyrenees south of Javarnia. Note the pretty drooping perianth

Primula pulverulenta, Bartley Strain

I wonder if the Bartley Strain of Primula pulverulenta is less hardy than the original form, for I have lost all my plants this winter of Lady Thursby and the other Bartley varieties, and I note that another correspondent has also. While nothing will kill the old crimson Primula pulverulenta, apart from being trodden on, the lovely Bartley varieties probably are more particular, and require a lighter soil, a rather warmer and less damp position. I have planted out all my Bartley seedlings in light shade in a position just referred to, giving them good light loam, with a nice mulch of old manure beneath them. I am hoping they will be more satisfactory like this.

Newbury.

Regelio-Cyclus Iris

The hot summer of 1928 provided a h like climate for Regelio-Cyclus Iris, they have started their spring growth great vigour and promise. For some I have tried the experiment of liftir August and drying off in a greenhou against leaving the roots permanently i garden. In most years one gets better fl from the lifted plants, but better foliage the undisturbed plants. This year, how it seems that the unlifted plants are goi flower exceptionally well and the folia more healthy and vigorous than I have seen it. One clump, planted five years is growing under a wall and is shad summer by a wine berry, which keeps the rain and the soil is bone dry. O clump, about 2 feet long by 6 i wide, there are already twelve buds sh and the leaves are almost of Germ vigour. No manure has been giv these except a little spent calcium c added some years ago. Two other u clumps in the open, not sheltered from rain, are also extremely vigorous, and have been undisturbed for five year generally flower fairly well. My soil, t on limestone rock, is a rather hot, dry and it seems that, provided lime is these Iris will do quite well when turbed, but after a dull year few flowers be expected. From my own experie should think the best way of all is to the roots unlifted, but protect from r soon as the flowers are finished.

E. A. BUNY

Forms of Anemone ranunculoi

Are there two forms of An ranunculoides in garden cultivatio have had the usual one for many but three years ago I found in a growing with Vinca minor in Haute an infinitely superior form. There large patch of it, and I noted that it several respects, different to the type. now well-established here in loam an mould in partial shade beneath codonoides. It is now in flower, and ference from the type is most marked usual form with me, growing in d places, does not exceed 3 inches in nor the leaves exceed 2⅛ inches acro flowers solitary and very small, the dark-coloured. The Savoie variety is 8 inches in height (with a measur leaves on the flowering stem 4½ inches the flowers generally two on a stem a as Anemone nemorosa and of a rich cup-yellow. The stems are green.

Horsted Keynes. MEILOR BRID

[Mr. E. A. Bowles kindly informs there are at least four forms of A ranunculoides:—The northern type small round flowers (Holland, Ge Scandinavia, etc.). The southern especially on slopes of Mte. Baldo. E the larger one referred to. The flowe out flatter. It is generally rather mo cult to grow, and shy in flowering in gardens. Then there is a pale coloured form and a good semi-double.

The Acanthus

Why is it that the Acanthus is deservedly neglected? Even in where it finds a place it is usually fo ing out a precarious existence at the a shrubbery where it has no chance its true form. When grown under conditions such a variety as A. molli of the most ornamental of plants, and if it does not surpass, most of the fine sub-tropical plants which were forme out of doors during the summer mor nt may, in the course of a few years, a spread of 8 feet or more, and it ow up a dozen stately flower spikes ght of 6 feet. Other good sorts are sus, A. hispanicus, and A. longifolius. districts all may succeed in partial ut in Scotland it is better to plant unniest position which is available. ily is easily propogated by means of ut division of existing plants is quicker. A SCOTTISH GARDENER.

Alyssum spinosum

being an old favourite of mine I glad to see it so worthily described Mr. H. Stevens on page 230. A. would appear to be more akin to an Alyssum, and it is now included genus Ptilotrichum. Here it has o be one of the best of all plants for sun-baked soil. It is, in fact, as proof as a House-leek, and will the flat or flop over the face of a h equal good-will. Even a place in l wall does not come amiss to it, and ot perfectly hardy everywhere I find permanent in such a position. As ens states, the little bush of a dozen height covers its silvery leaves with of white flowers in spring and early Although these blooms are small borne so profusely that, in combination the fine, angular stems and dainty hey suggest a delicate piece of lace. ion to the white-flowered type there ral colour forms of this delightful mong these one may find a variety s from pale rosy-mauve to a washy he best of these are, I think, Pt. roseum, in which the blossoms are pink. I have found this form in y as good as the typical species, and s a very charming mound when with its rosy flowers. Although it get above the stature given, a well-lant may ultimately cover 2 square 3 feet square at the base. These orms should, of course, always be ed by cuttings. A. T. J.

her the lesson seems to be that shrub or plant is well established and far more frost than is usually credited, as all the above were quite unprotected. S. J. KNILL.
Barnstaple.

—— Sir William Lawrence's note on the above made interesting reading. It certainly is curious the plants frost affected and those which withstood it. Here Carpenteria californica, Diplarrhena, Moræa, and Chrysanthemum Mawii came through untouched. The old Eucalyptus globulus trees will lose every leaf, yet young trees 15 feet high are not hurt. Eucalyptus Gunnii is also untouched. The Glory Pea, Clianthus puniceus, on a south wall, is nearly killed, and so is Calceolaria violacea on the east wall.

Iris japonica seemed to thrive on the hard weather and is already showing signs of flower. Daphne indicum is in flower now and was not touched. Cordylines suffered here badly, Gilia californica and aggregata were killed outright, but most of the Callistemons, Billardieras, Mutisia decurrens are safe, and I see Lathyrus splendens is breaking from the base. R. MOORE.

Ptilotrichum (Alyssum) spinosum roseum

Vegetables under paper

In your issue of April 27th, Mr. Hayley asks about this method of growing vegetables. It is not by any means new. In fact, is a very old system, but has not (I think) been tried on commercial lines in this country. Paper was greatly used 80 or 90 years ago by the best type of gardener. In fact, the lights of frames were made of light lathe wood, on which the paper was drawn tight and tacked. It was then given two coats of boiled linseed oil and allowed to dry thoroughly before using. It was a special white cartridge paper, very strong, and had the advantage of being cheap and durable and light to handle, besides being warmer in frosty weather than glass. I have made and used many of them. Where frames were scarce and when the lights were wanted for another frame, the paper frame was used; it protected the plants from the sun and kept the soil moist, or rather kept the moisture from evaporating, and enough light went through to keep the plants from drawing unduly. I have, and do at present, used paper outside for protection on small plots of seed, and hardly ever sow a box of seed without a covering of paper. It is warm and will keep out almost any degree of frost if used as a protection around a plant in the winter and spring.

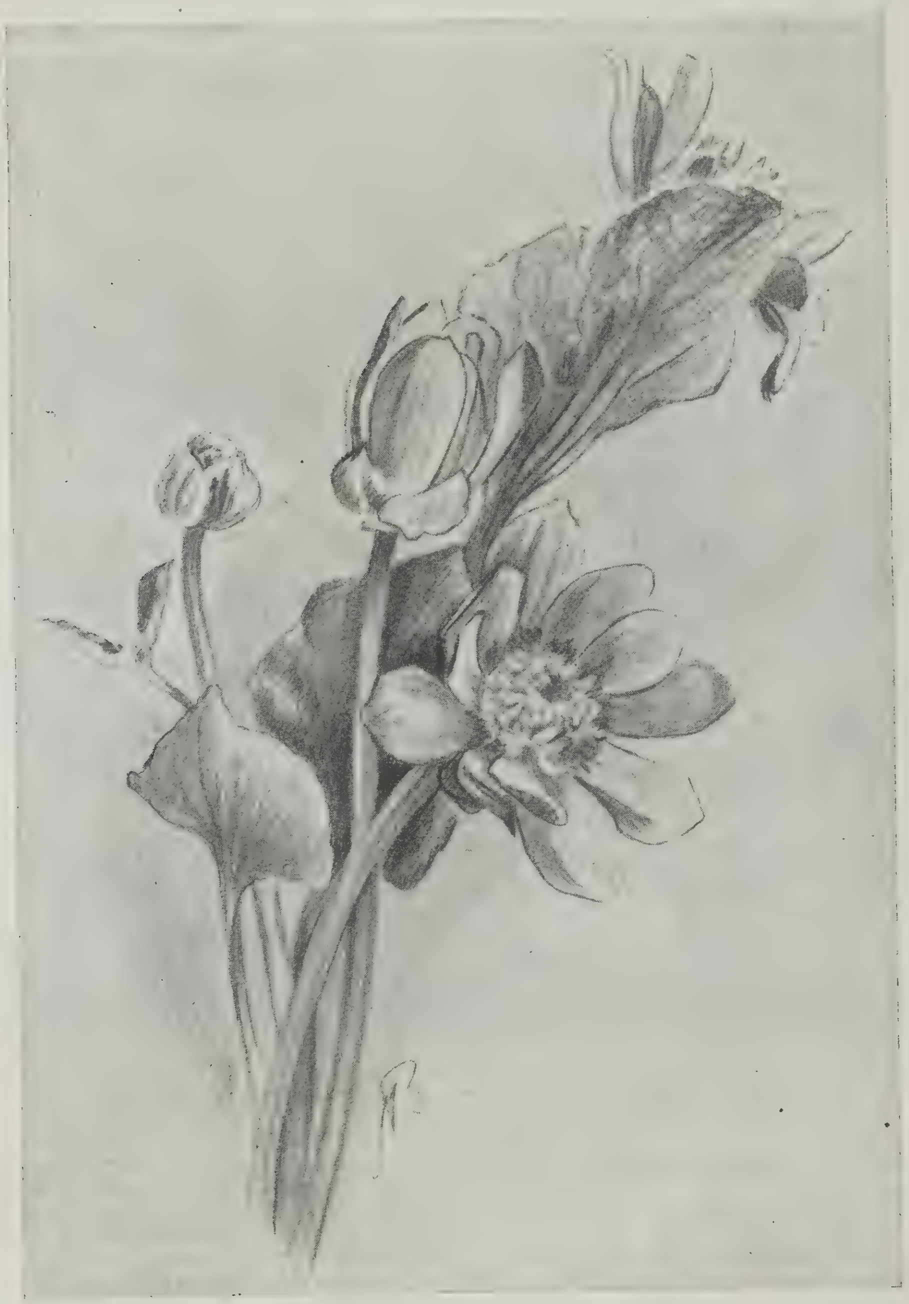
A choice Rose, or any other plant, with a covering of paper will stand the severest winter, and many times have I used same for protection The only trouble being, it is liable to get torn in the wind unless tied down. Seeds can be sown under it. It is a splendid covering for sowing Alpines (acting like a covering of snow to them in their native habitat.) In regard to using it on a large scale, when talking to a Dutch Bulb traveller, over 30 years ago, he told me that the German growers were using it on a large scale to cover the early vegetables. The paper was in large rolls and they simply pushed a pole through the centre and then dragged it along the beds they wished to cover. It was of a certain width and strongly made white paper. It was easily put on and taken off, and, of course, the only trouble would be the wind. The paper was put on as flat as possible, no hollows being left for water to lodge. He told me they got much earlier crops by this method.

Whether it would be cheap enough in Britain to use, I do not know, but it could be used easily in small places and by amateurs for protection of choice plants and seeds of all kinds; also if tried over fruit bushes in spring would protect them from spring frost. Ordinary newspaper is good, but does not last long, being of a soft nature. For protecting Chrysanthemum blooms in the autumn, it is often used by cottagers when preparing for shows.

TRANSPLANTED THISTLE.

Ficaria grandiflora

PERHAPS it is because the native Lesser Celandine is such a tiresome weed in some gardens that many people fight shy of the beautiful southern form shown in the drawing. It is, however, a precious possession when well established in sunny positions at the base of shrubs—deciduous ones for choice. It is frequently one of the first plants to show flowers in the New Year, and the largest form, from Algeria, will give a flower or two in December if the weather is favourable. If grown in moist ground in semi-shade it flowers later and becomes taller, with very large flowers and leaves. Again, it is a good subject to grow in a pot in a frost-free house and to bring into a sunny window in the early days of the year.



From a drawing by E. A. Bowles

Ficaria grandiflora

It will spread rapidly and be difficult to get rid of if its allotted portion of ground is dug and disturbed, for it forms abundant small tubers, every one of which can grow into a plant if separated from the parent, just as is the case with the ordinary Lesser Celandine. Therefore it should be planted where it is wanted, and there be left alone to form a charming carpet of rich green leaves under its brilliant yellow stars glistening in the sunlight on those precious days of late January and early February, when the warmth brings out the bees to the Crocuses and the Snowdrops lift their skirts to show off the green embroideries on their stiff white petticoats. It is also known as F. calthæfolia; no bad name either, for its leaves can be as large as those of the Kingcup when the plant is really happy. I have collected various forms and sizes of it in Algeria, Greece, and Italy. The Algerian form is the best, but is another instance of size and tenderness going together, and this horrible winter has punished it badly.

The Italian forms have not been injured at all, but have been retarded to flower in March, about six weeks later than their usual appearance. The white form of the common Lesser Celandine and the three known double forms are all favourites of mine, and they neither increase too rapidly nor appear where they are not wanted, because I just leave them alone. Another good point in their favour is the way they disappear—one
say melt away—when they have fi
flowering and the days are long and w

ting them rest in peace, I have heard
f those who come with sacks and
skets, and not only pick the flowers
le, but grub up the bulbs as well, and
m. We have put Rhododendrons,
a wood bordering on the main road,
e idea of beautifying it and giving
to the passers by, but these often
eir branches torn off, sometimes by
ts, who ought to know better. One
even cut off the top of a Chinese
last year for a Christmas tree. How-
e caught four of the delinquents the other day, and I shall have to prosecute them as a warning to others.

But now for my sins, and to my great disgust, I have caught the infantile disease of German measles, and have to stay in one room for a week, leaving all my precious seedlings to be watered by someone else, and wondering what casualties I shall discover when let loose. It is too provoking! But as one enjoys going round the garden after absence from home, so I am anticipating a pleasant walk before long and some progress in most things. For, after all, it is spring, in spite of north winds and an entire absence of rain. . . . Yes, and the walk was pleasant, for many things had come out during the week, amongst others Magnolias conspicua and kobus, and one or two rather notable Rhododendrons.

But how detestable it is to leave the watering of one's seedlings to the gardener. So far as I remember there was a great Earl of Strafford whose motto was "Thorough." I have always admired him, and oftentimes wished that my gardener would adopt the same rule in life. But he is probably incapable of doing so, as are many of his kind. They water superficially, and the top soil looks damp when the master comes round, but next day an unnatural dryness shows itself. This is bad enough for established plants, but very much worse for seed and small seedlings, and I am terribly afraid that several boxes of Stuartia pentagyna may not germinate as a result of this treatment, and certainly one or two boxes of Rhododendrons are looking very sick. And the two notable Rhododendrons. One was R. Daphne, named after Lady Weymouth, the parentage of which is Bloodred arboreum x Thomsonii x neriiflorum. This is practically a Hose-in-hose flower, and its colour is the pure red of neriiflorum, but a trifle darker. Three of them there were on an 18-inch bush, and one hopes that the sister plants will be equally attractive.

R. agastum, of the irroratum series, was the other treasure. This arrived as a rogue among some other Chinese seed. It appears to be perfectly hardy and is a large white flower with delicate pink buds which have a big dark crimson blotch in the interior and some spots of the like colour on the upper lobes. The bloom is much larger than that of irroratum, and the plant has bigger and more leathery leaves. There is a curious hybrid from M. de Vilmorin out too, made, I suspect, by M. Mottet, and supposed to be polylepis x lutescens, though I rather wonder whether R. lochmium is not really one of the parents. It is very floriferous and of an uncommon yellow-pink colour with a touch of fawn, which is unlike anything I have seen before.

A group of Osmanthus Delavayi is particularly effective this year, for it entirely escaped the frost, and presumably last summer suited it, since every twig is a mass of scented white flowers. Two years ago it bore a certain amount of fruit, hanging drupes like small Cherries, and these I sent to a correspondent in British Columbia, but have not heard whether the seed germinated.

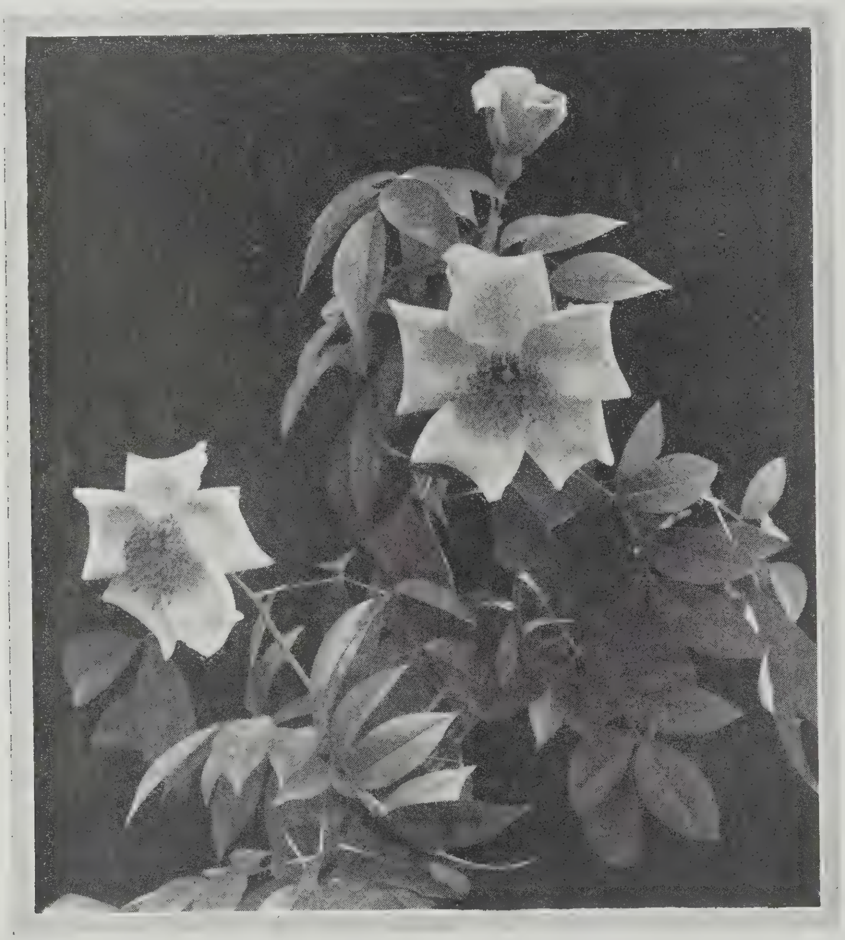
A newcomer to this garden is Sutherlandia frutescens. A friend who lives in Sussex

Rhododendron lutescens, which escaped the frost

It is the first of the triflorum series to open its flowers sent me seed of it two years ago, and the resulting plants stood the winter in a cold frame without the least injury, and I have just planted out the best specimen, which is bearing an abundance of its sealing-wax red Pea flowers, and very ornamental it is.

A nice little batch of Primula rosea had lately come out, and was giving us great pleasure in a damp spot alongside the drive, but in one night the ubiquitous and abominable rabbit ate off every single flower-scape. To-day I have had an experience which would be amusing but for the waste of time entailed. The Vicar of a neighbouring parish, who always applies to me for material wherewith to decorate his church, wrote that he proposed calling on me to get my advice on certain Rhododendrons in his vicarage garden. This evening he bicycled over, but I could get nothing coherent out of him, so I sent him home and, after tea, got in the car and went on a visit of inspection. His Rhododendrons were all Ponticums, and were planted tight under the boles of Beech trees.

Peter the Hermit.



Rosa gigantea

Awarded the R.H.S. Cultural Commendation when shown by the Director of the Botanic Gardens, Cambridge, on April 23rd

Cheiranthus Allionii

Cheiranthus Allionii is a perennial, but young plants are always to be preferred, and if, when the first flush of bloom is past, the seed vessels are removed, the plants will bloom practically throughout the year. I have, in a rock edging, many plants yet in fine flower which were put out in October of last year, and which began to bloom in April. C. Allionii is faintly and pleasantly perfumed.

A Scottish Gardener.

Rosa gigantea

It is such an unusual event for this Rose to flower in this country that when it does so it is worth recording. It was first discovered in Manipuh in 1882 at an elevation of 7,000 feet in the Shan Hills, Upper Burma. It is also a native of Western China, where it has been collected in Yunnan.

Rosa gigantea grows and flowers well on the Riviera, and has been used quite a lot for hybridising, but although it is hardy in some parts of England the sun apparently has not sufficient power to bring it often to the flowering stage.

It is said to have first flowered in Europe in 1898 at the Château Eléonore at Cannes. It is first recorded to have flowered in England at Albury Park, Guildford, in 1903, when two flowers were produced, again in 1904, and also at the same place in 1905, when it was shown at the Royal Horticultural Society meeting on February 28th and given a Botanical Certificate as well as a Cultural Commendation. Since then it has flowered at the Royal Botanic Gardens, Kew, in 1910, while it bloomed for the first time in the Cambridge Botanic Garden in 1917.

Undoubtedly due to the fine summer of 1928 this Rose is again at the present time producing a good display of its handsome flowers in the corridor of the range of glass-houses at the Botanic Garden, Cambridge, where it climbs along the roof.

Rosa gigantea is a very vigorous climber, and in its native country runs over trees, forming at first straight-branched stems as thick as 3 inches to 4 inches in diameter. The leaves when young have a rich bro green tint, becoming pale shining green mature, and consist of five to seven le The prickles are very few on the flo branches, which are short, sharp, ar curved, whilst on the young flow shoots these are large, massive, flat recurved.

The flowers are a beautiful g yellow in the bud stage, becoming pale age, particularly when exposed to the then almost white, and are from 4 inc 6 inches across. The plant is supposed the origin of the Tea Rose. It certain the delicious scent of it. The sepal linear-lanceolate, about an inch long are white on the inner surface. The are orbicular-obovate, while the stame numerous and the anthers are of a orange colour.

The fleshy fruits, which become as la small Apples, are said to be eaten Nagas.

George H. Pres

University Botanic Garden,
Cambridge.

Rose species of garden val

Some species of Rosa, by virtue o elegant growth, their delicately be flowers, and in some instances the sistent and highly coloured fruits, oc very prominent position amongst plants, and of them Rosa Moyesii is p larly desirable. This magnificent C species produces flowers of a colour to describe and of a penetrating brillia have heard the colour called a rich cotta-red. They are freely produced somewhat straggling growths, are sin curved, and quite 3 inches across, a succeeded by large scarlet fruits, th sisting until December in favourable s The plant will form a large and ha bush or it may be utilised as a climbe like R. Hugonis, it requires ver pruning.

R. Hugonis, also from China, prod May crowds of canary-yellow flowe beauty greatly enhanced by the at Fern-like foliage. Very handsome isolated specimen, in groups or as plant, this comparatively new species find a place in all gardens.

In R. Willmottiæ we possess a st beautiful Rose of ample and elegant The Fern-like, greyish foliage is a foil to the rosy-carmine flowers, wh freely produced. This species sh allowed to develop its natural grace line and it should be given a sunny on sloping ground.

R. rubrifolia is noteworthy for its foliage and red stems, and is fine for effect.

R. nitida is a lovely plant and is es welcome in the rock garden, where mer its red flowers are very attract are succeeded by scarlet fruits. The shining dark green in summer, ch autumn to a purplish hue, so that th shrub, some 2 feet high, is interest the greater part of the year. A American species, R. nitida was int so long ago as 1807.

R. sinica, with its large white flow shining leaves, the former with stamens, is superb for a warm wall, very lovely variety, R. s. Anemone, wi single pink flowers.

R. spinossisima maxima, sometime R. altaica, forms a large ramblin clothed with single pale yellow flow is ever an object of interest and adm

There are many others, but enumerated are capable of creating so fine garden effects.

Primula anisidora

nula anisidora is a bog plant, and is a of the Chungtien Plateau in Yunnan, it grows in moist places at an altitude ut 10,000 feet above sea level. It be- to the Candelabra section of the genus la, and it has smooth leaves with ld margins. The flowers are borne in n a stem about 18 inches tall, are of maroon colour, with a bright yellow nd are ¾ inch in diameter. The whole n including the roots, gives off a sweet d perfume. It thrives in a good moist and may be treated as a bog plant the growing season. It is possibly satisfactory when treated as a biennial.

Gavin Brown.

Creagh Castle strain Anemones shown by Mrs. Bucknall. Gold Medal

Primula frondosa

This beautiful spring-flowering Primula is a native of Thrace, where it grows in open sunny mountain pastures. It belongs to the Farinosæ section of the genus Primula, and is not unlike P. farinosa itself, though larger in flower and a little deeper in colour. It forms a rosette of egg-shaped leaves about 2 inches long, which are covered on both surfaces with white meal. It forms a large clump, comprised of numerous crowns, and should therefore be divided occasionally. From the centre of the rosettes slender, erect stems, also mealy, arise to a height of 3 inches to 4 inches, bearing an umbel of pale lilac blossoms, fully ½ inch in diameter. It thrives in an open, sunny position, in a fairly moist, heavy loam.

Thinning Fruit Blossom

By E. A. Bunyard, F.L.S.

THERE is an abundant promise of Apple and Pear blossom in the South, and, all being well, a bumper crop should follow. Perhaps nothing is more harmful to fruit trees than overcropping, and certainly nothing more unprofitable to the commercial fruit grower than the glutted market. It is probable, therefore, that the success of the fruit season will depend upon rigorous thinning, and, as a first step, the thinning of fruit blossom should be considered. Though little practised in this country it is frequently done in France, especially with Pears, and it has, of course, many advantages over fruit thinning. First of all, if we reduce our blossom by half, so much less is taken out of the tree in setting the young fruit and the consequent withdrawal of food supply from the tree and soil, which is only wasted. It is not often realised what an immense strain on the trees' food reserves takes place during the blossoming and the early stages of setting of the fruit, and it is a well-known adage that a large amount of blossom does not mean such a good crop of fruit as a moderate one. Secondly, the insect population does not increase with the extra blossoms, and therefore the chance of pollination is greatly reduced, but by thinning half the blossom success is more likely in this direction.

Flower thinning can be most easily done by a pair of Grape scissors so far as the Apples are concerned, and the central blossom of each truss is usually the strongest and should be left in preference to the side flowers. As to how many flowers should be left, the number of trusses is, of course, a guide, but if we reduce the number of flowers by half in a year of abundant blossom, this should amply provide for eventualities. There are usually some late and little developed buds on Apples and these are valuable and should be left on, as in cases of severe spring frost, as in 1928, it was these laggard blossoms that provided the crop.

With Pears the flowers are more in the nature of a raceme, *i.e.*, radiating from a central stem, and it is easy to pinch off, say, half of each truss, and in this case the lower flowers are usually better fruit producers.

When the flower buds are separated in the truss, so that they can be easily snipped off, the work can begin. It requires some courage to throw half the blossom of a tree on the ground, but if we keep in mind the fact that a large crop of small fruit is valueless, and some definite standard of, say, one fruit per truss if the spurs are near together, such boldness will find its due reward in the autumn months.

Spring treatment of Vines

A SHARP look-out must always be kept for mildew, and as the rods in houses are breaking into growth, every effort should be made to prevent it this summer. Errors in ventilating are a frequent cause, as are watering, or the want of water. A soddened border and an atmosphere parched and draughty, or dry roots in a damp house, must inevitably be followed by mildew.

In summer spells of cold, damp weather sometimes set in, when the leaves are in the soft stage, and some growers make the mistake of shutting up all ventilators quite tight and not opening them until sun has sent the thermometer too high for the good of the Vines. Such treatment is bound to bring on mildew. It is now time to begin to correct these evils by giving the Vines a fair start. No matter whether the structure is heated or not, a low temperature should always be the rule to commence with. Until the buds are on the point of breaking, keep the pipes only just aired, and in cases where there are no pipes, then ventilate on all occasions when the weather is favourable.

The great thing is to let the rods break as naturally as possible. Always keep in mind what is prevailing with our fruit trees in the open.

To the inexperienced or amateur I quite understand it is difficult to distinguish between damp and wet soil in an inside border, but I think it will help them if they overlook the fact that damp is cold, and that cold
not always denote an indication of suffic
moisture; that is, of course, as far as
are concerned.

The rods should be sprayed in the mor
during the early stages of growth, and
a day when growth is more advanced, but
last operation must be early enough to a
the water to dry up before night. Someti
rods have a tendency to break at the
only, leaving the rest of the buds at a st
still. In such cases, loosen such rods
the wires and let them hang down so tha
flow of sap is steadied. About this stage
temperature should be about 50 degs
night, with a rise of 5 degs. by day wit
sun heat. Progress will then be steady,
when the shoots are an inch long a
more warmth should be given. At this
we shall be able to see which are the str
est shoots to aid in disbudding. In
operation the general rule is one shoot
spur, but it is as well to disbud gradual
avoid accidents. Rods sometimes deterio

ato growing in small houses

rule, in many houses, the end of or early April is quite soon enough to Tomatoes, whilst in not a few places g can be done until May when some garden subjects can be removed to ames for hardening. I know some, nce were very keen on raising their lants from seed, sow it early in the ut the necessary heat which had to be -and which was not required for other nts—proved more expensive in the un than purchasing the comparatively ants they needed. The average man wants but a small number of Tomato two or three dozen at the outside, and him to procure them from those who a business of raising, and so by May his house is relieved of other things, oes can be potted or placed in boxes t away. If the truth could be told the cost of fuel, and the failures h damping off and inadequate warmth es, the one who procures his plants as hen he wants them is the gainer.

l and May bring more sun, which is der glass, and Tomatoes feel the beneft. It is one thing to be able to devote e exclusively to Tomato growing, and r to bring on young plants amongst hings. Tomatoes resent a check, and heat can be given from the commenceuntil weather conditions improve, and regular heating of the house unary, it is better to defer making a start. horoughly convinced that uninterrupted in Tomatoes is more to be considered etting fruit early without regard to the production. W. F.

Runner Beans

Runner Bean is in constant demand ur large gardens from July to October, also the most important green crop in titude of cottage gardens, allotments, en in the tiny backyard gardens of our towns. It grows freely and serves the purpose of embellishing unattractive es and affording wholesome food. of the warmer regions of South ca, it is a very tender plant and will mb to a slight frost which the Dwarf Bean growing alongside would en- It is thus possible to obtain earlier s from Dwarf Beans than from rs, but in weight of crop and duration son the Dwarf types cannot compete he Runner, and by many the flavour of ter is preferred.

Runner Bean is a moisture-loving subnd a period of prolonged drought is rying, especially on light, porous soils. sure continuity of supplies, therefore, it d practice to grow the plants in well- ed trenches where the soil has been worked and had abundance of organic e incorporated with it, thus rendering e retentive of moisture. On heavier his may not be so necessary, but in all the ground should be deeply worked ell manured.

hing is gained by too early sowing outnd about the first week in May is early h to make the first sowing. A further g may be made in the first half of June intain supplies later in the season, but uld be noted that continuity of supply gely controlled by method of gathering, othing tends to arrest the development of successional Beans so much as leaving a few pods at the base of the plant to mature seed. If the pods are gathered as fast as they become ready those that follow have a much better chance of development.

Although large areas of Runner Beans are grown under field culture conditions without supports, by practising a system of pinching the growing points better results and heavier crops are obtained by affording stakes; long, stout Pea-sticks form the most useful supports. If these are inserted on each side of a double row, slightly inclined to the middle and securely attached to a horizontal rod at a convenient height, they form an ideal structure for the plants to climb on and prevent them from suffering during rough, windy weather.

The modern varieties of Runner Bean are marvellous productions and a striking example of the advance made in the food value of varieties of vegetables in the last few decades. So recently as the 'eighties of the last century a grower in Oxford acquired fame by producing Beans of unusual size for that time, some sample Beans "measuring 9 inches from the beak to the handle and weighing exactly one ounce." It is nothing uncommon for our present-day varieties to double these figures, and the increase is not in the least at the cost of quality or refinement in appearance. Under good conditions of cultivation the modern 18-inch Bean is a handsome model, almost stringless and containing flesh of splendid cooking qualities, while the free-bearing character of the plant leaves nothing to be desired. W. AUTON.

Celery trenches

These must now be prepared in readiness for the earliest kinds, which will be large enough for planting out towards the end of the month. Trenches for double rows should be from 15 inches to 16 inches in width and about the same—or on heavy soils slightly less—in depth. The bottom of these trenches should be deeply broken up and a good layer of well-decayed manure placed thereon, and over this 3 inches of good loam to plant in. See that the young plants now growing in frames do not suffer from lack of moisture, and when about 4 inches in height gradually harden off, ultimately standing them in the open.

Rhododendron Linley Sambourne

Rhododendron Linley Sambourne

THIS hybrid was the result of a cross made in 1913 between a large-flowered hybrid and R. Loderi, not at that time in commerce. In habit the plant is somewhat tall and loose, but the branches are well furnished with long, dark green foliage. The large trusses are made up of widely expanded flowers, in colour a rich, rosy pink, with a deep carmine blotch at the base of the segments. It received an Award of Merit at the Rhododendron Show, May 1st and 2nd, 1928.

The writer had been invited to view a plant of R. Loderi, a gift from Sir Edmund Loder, then in bloom for the first time, and was very kindly given a flower to carry home. On the way, the potency of the plentiful pollen contained in it was realised, and later used to pollinate a number of species and large-flowered hybrids. Careful records were kept, and some six hundred plants raised in the spring of 1914. But soon the men, and even the boys as they grew up, left for the "Front," and an untrained lady-gardener, previously a milliner, took charge, but, hard worker as she was, she did not realise the importance of keeping batches of seedlings separate, with the result that although one parent of R. "Linley Sambourne" is well known, it is not wise to be too sure about the other. J. COMBER.

Achillea umbellata for the dry wall

This is a pretty dwarf rock plant, and one eminently suited for growing in the dry wall, where its beauty can be seen and admired at all seasons of the year. It is a fairly fast-growing plant, and very quickly establishes itself in new surroundings. The flower-heads, consisting of six or eight white flowers, are produced in the form of a simple umbel during the summer. Its regularly lobed leaves are clothed with a dense silvery pubescence, which enhances the beauty of the plant.

It is advisable to divide and replant it about every third year, when it develops a straggly appearance. This may easily be done by pulling the plant apart and replanting the pieces, which will re-establish themselves in a very short time. J. L.

Rhododendron intricatum

MANY of the dwarf Rhododendrons are well adapted for use in the rock garden, and among them R. intricatum well deserves its place. The variety, while it is a robust grower, never becomes over-exuberant, and its delicate blooms are always welcome early in April. I have in mind in my own rock garden a plant of R. intricatum, the soil beneath which is carpeted with Synthyris reniformis. The combination is perfect, the two plants blooming simultaneously and harmonising remarkably well. Certainly R. intricatum varies in colouring in different gardens, but I am inclined to attribute the variation to soils and, perhaps, in a less measure to exposure. Be that as it may, R. intricatum is a most desirable plant.

A SCOTTISH GARDENER.

Deutzia Veitchii

THIS is quite one of the best Deutzias, if not the best, and is a very effective small shrub as an isolated specimen, in the shrub border, or trained against a wall. D. Veitchii was introduced from China by Mr. E. H. Wilson about 1912, and it received A.M., R.H.S. The flowers are large, and a very beautiful shade of pink in colour, the panicles ample and freely produced. It comes very near to D. longifolia, and, indeed, sometimes D. Veitchii is listed as a varietal form of that species. The latter is, however, better coloured, and, I think, a superior acquisition. If not of very rapid growth, these deciduous shrubs are not fastidious, and will thrive in any ordinarily good and well-drained soil, in a sunny position; they are very beautiful when planted on a large rock garden. I well remember a particularly pretty effect created by D. Veitchii growing against an old grey stone wall.

RALPH E. ARNOLD.

Genistas: Fragrant flowering shrubs

Cytisus fragrans, popularly called Genista, is a refreshingly fragrant, yellow-flowering evergreen shrub, useful for pot culture for bringing into bloom in the greenhouse in spring. It is a shrub which appeals to many, inasmuch as it can be successfully grown in a greenhouse where only a moderate temperature is maintained in winter, and anyone who has a house which is kept at about 50 degs. need have no hesitation in taking it in hand. A few plants in a house in flower are sufficient to fill it with a delightful perfume which reminds one of the fragrance of the Lemon-scented Verbena (Aloysia).

To grow them to perfection Genistas need to be potted in a compost of loam two parts to one of sand and fibrous peat. Grown in 5-inch or 6-inch pots they are most useful for window and table decoration. After plants have ceased to bloom they should be cut well back, kept within the warmth of the greenhouse for a time, and well syringed in order to encourage new growth, afterwards being removed to a cold frame until the weather admits of their being stood or plunged out of doors for the summer months. They should be well looked after in regard to watering when so located. Propagation can be effected from cuttings of the new wood taken off when several inches long, or a selection can be made of half-ripened non-flowering shoots before plants are cut back. Those taken with a "heel" are not long in rooting if placed in a striking pit or in pots of sandy soil and plunged in warmth. Quite nice little specimens can be grown in $3\frac{1}{2}$-inch pots, but it is when potted on into 5-inch pots that they are the most appreciated. From about 18 months from striking these make very desirable plants.

W. F.

Shrubs of Recent Introduction

By HERMAN SPOONER

During the last half century a great change has taken place in gardening as practised in this country. Perhaps the greatest change of all is in the taste that has been developed for hardy plants, particularly for hardy flowering trees and shrubs. Although a number of very fine species were available before the period mentioned, they were, for the most part, lost in the dismal plantations that were known as shrubberies, whose main purpose was to give privacy or shelter, and not primarily to display the beauty of the trees and shrubs that composed them.

(Concluded from page 272)

TO the Deutzias have been added the fine D. discolor major, a form with arching sprays of large rose-coloured flowers, and D. longifolia Veitchii with flowers of a rich, rosy purple, both distinctive plants in the family to which they belong. The Spiræas have been enriched by the new Chinese S. Henryi, a large-growing kind, from 6 feet to 9 feet high, producing corymbs of pure white flowers at the ends of the twigs along the whole length of the arching branches; and S. Wilsonii, a closely allied species, and similar in general appearance. S. Veitchii, also from China, and probably the best of the Chinese kinds, is a strong-growing kind, producing shoots 6 feet in length in one season, and in June corymbs of pure white flowers along their entire length.

Rhododendron intricatum in the rock garden

The additions to the large genus Rhododendron from China have been very numerous, the mountainous interior being apparently the headquarters of this fine family. Many of them are of botanical interest only, but there are some fine forms that may prove of great value to the breeder. Amongst so many good things it is difficult to make a selection in a short article such as this, but mention may be made of the dwarf-growing species, of which R. intricatum is a type. This is a small bush, clothed with roundish leaves not over $\frac{1}{2}$ inch long, and covered with glistening scales. The flowers are produced very freely in trusses terminating the branches; they are about $\frac{3}{4}$ inch across, and of a pale violet-purple colour. For the rock garden, or for mas
as a carpeting for Lilies and other such
growing plants, this species and its allie
decided acquisitions. Another Chinese sp
of earlier introduction, and therefore b
known than the preceding, is R. rac
sum. This is also a dwarf kind, growi
about 5 feet to 6 feet, of a neat, bushy h
with small leaves up to about $1\frac{1}{2}$ inch
length. The flowers are borne in prof
in April and May in the axils of the u
most leaves and terminating the bran
They are of a variable shade of pinkish
about 1 inch across, and very charming

The wild Roses have also received
new kinds that are too numerous to me
in detail. Perhaps the most distinctiv
garden purposes, by reason of the u
colour of its flowers, is R. Moyesii,
W. China. This grows about 6 feet
feet high, and has abundant, fine, needl
prickles, and neat dark green leaves
posed of from seven to ten leaflets.
flowers are of a deep brick-red c
2 inches to $2\frac{1}{2}$ inches across, and are foll
by drooping, bottle-shaped red fruits
inches long.

The genus Berberis, which includes
fine garden plants as B. Darwinii, an
hybrid stenophylla, has been greatly enr
of recent years by new kinds from C
Amongst the latter are both evergreen
deciduous species, valuable not onl
flowering plants, but also for their au
colouring and ornamental fruits which
retain throughout the greater part o
winter. Although not finer than the
kinds mentioned, some of the newer
ductions possess special features that
them valuable as garden subjects. Pe
the most generally attractive is B. Wil
a charming dwarf species, seldom more
3 feet high, with neat, small leaves that
a beautiful red before falling, and abu
berries of a bright pinkish red that a
chief attraction. Another deciduous s
that produces brilliant autumn colouri
B. polyantha. This attains a height
feet or 8 feet, and the slender, a
branches are clothed with leaves 1 in
2 inches in length, broadest at the tips.
bright yellow flowers are produced in
abundance in axillary panicles, and
followed by vermilion berries, which
a fine splash of colour after the leaves
fallen.

Amongst the evergreen species of Be
may be mentioned Gagnepainii, which
about 6 feet or 7 feet high, and has a
stems, clothed with dark, dull green, n
leaves up to 3 inches in length, and to
along the margin. In autumn the
leaves assume a reddish tinge and fo
pleasing contrast to the dark, purplish
fruits, which succeed the clusters of
flowers. For massing in beds or for fo
a low garden hedge this species is dec
useful. Another evergreen is B. pru
the stems of which attain 6 feet to 10
clothed with spines, and light, glossy
leaves, 1 inch to 3 inches in length, the
of which turn a bright red in autumn.
flowers, borne singly or in clusters, ar
lemon yellow colour, and are follow

ies of egg-shaped black fruits, thickly with a waxy "bloom," which give bluish colour. Another pleasing ever- s B. verruculosa, also from China. It t 4 feet high, and has dark, glossy eaves, that are glaucous beneath, and inch to 1½ inches in length, arranged ters on the branches. The bright flowers are succeeded by blackish hat are coated with a thick white wax, them a striking and conspicuous nce.

hy to rank with the Barberries for reat variety, rich autumn colouring, illiant fruits are the Cotoneasters. amily, like that of Berberis, has re- many recent additions from China, which have distinct merit as garden s, either for decorative work, or as and cover plants. The best known, oldest of the newer kinds, is C. talis, introduced about 50 years ago. as low-spreading branches that are with small leaves about ½ inch long, kish-white flowers that appear singly, all over the plant during May. The red fruits persist after the leaves have which they do late in the year, after ng orange and red tints that are very ve.

ntrast to this species is C. Henryana, green, 8 feet to 10 feet high, with green leaves, 3 inches to 5 inches in and tough and leathery in texture. ite flowers produced in corymbs in e followed by crimson fruits. Another ine evergreen species particularly ve when in fruit is C. ballata, intro- rom China by way of France. This nted, dark green leaves, 2 inches to 3 inches long, and felted beneath with grey or yellowish down. The flowers in corymbs are succeeded by pear-shaped fruits of a brilliant red, which are its real attraction.

Deutzia longifolia Veitchii

Flowers rich rosy purple, borne in axillary clusters. One of Wilson's introductions from China

Belonging to the same family as the Cotoneasters is Stranvesia undulata, a recent introduction from China, remarkable for the beauty of its bright red fruits, which are abundantly produced, and for the red autumn colour of its older leaves. Climbing plants have also benefited by recent additions from China, especially the Vines, although nothing superior to the older Vitis Coignetiæ is amongst them. The Vines are, of course, valued for the beauty of their habit and foliage, and for their fine autumn colouring. The most meritorious of recent introductions are V. armata and its variety Veitchii, which have large, heart-shaped leaves, often 10 inches long by 8 inches broad, the leaf-stalks and principal veins covered with gland-like processes; V. Henryana, rather tender, with compound leaves consisting of three to five leaflets, of a rich velvety green, with pink and silvery veins; V. leeoides, a species having pinnate leaves up to 1 foot in length, green above and purplish beneath; and V. reglaophylla, similar to the preceding, but with doubly pinnate leaves, often 2 feet in length, and very striking in appearance.

Magnolia stellata planted at the waterside

One of the finest of all early-flowering shrubs

Amongst flowering climbers the most striking addition is the lovely rose-red variety of Clematis montana, known as rubens, which forms a charming companion to the type. The evergreen species, C. Armandii, is also a fine plant. It has trifoliate, leathery leaves, in the axils of which are borne the clusters of creamy-white flowers, each of which measures about 2½ inches across. This list, lengthy as it has become, includes only those species or varieties introduced from their natural habitats in distant countries, and it takes no account of the many fine additions to our hardy shrubs which nurserymen and others, in this country and on the Continent, have evolved by cultivation and hybridisation. These latter include many fine plants belonging to such families as the Lilacs, Mock Oranges, Ceanothuses, Spiræas, Diervillas, flowering Currants, etc., to say nothing of Rhododendrons and Azaleas, which are in a group apart. It will be gathered, therefore, that these new introductions and improved varieties provide a vast amount of good material for the hardy shrub garden, in addition to such old favourites as Crab Apples, Thorns, Cherries, Laburnums, Wistarias, Honeysuckles, Kalmias, Heaths, Cistuses, etc. If wisely selected, it is now possible to have in the hardy garden shrubs or trees that will bloom throughout the year, and autumn effects in fruit or foliage equal in splendour to the beauty of the flowers

Hollyhocks

Although much hardier than the Dahlias, it is risky to plant them out early, more because of the damage caused by wind than by frost. If, however, the weather gets genial they can now be got out. See that they do not suffer from dryness at the roots.

REMINDERS FOR THE WEEK

Southern and Midland

Sweet Violets

Abundant material is now available with which new plantations may be formed, and this will permit of the frames in which they have been growing being used for other purposes. The position for the plants should be enriched by well-decayed manure, dug over deeply, and for preference in partial shade. When lifting the plants remove the strong, healthy side shoots only for transplanting, and these should be planted in lines 1 foot apart and from 9 inches to 1 foot apart in the rows. If the weather continues dry, water must be given at frequent intervals until it is apparent that the plants have taken hold of the soil.

Lobelia cardinalis

This handsome Mexican flower in all its varieties may now be planted where it is intended to bloom. It thoroughly enjoys a deep, moist, leafy soil, and in such the plants will attain 5 feet to 6 feet in height and produce very handsome flower-spikes. Any old plants which have wintered safely in the open should be lifted, divided, and replanted at 1 foot apart on fresh ground.

Alpines and perennials from seed

These come very freely if sown in sandy soil at the present time. The boxes, pans, or pots used should be well drained and placed in a cool closed frame, where they should be shaded from bright sunshine until germination has taken place. Seeds which may also be sown on well-drained borders in the open include all kinds of Wallflowers, Honesty, Delphiniums, Columbines, Harebells, Hollyhocks, etc.

Hardy annuals

Those which for convenience have been raised in frames and grown on in readiness for the beds and borders may now be planted out, water being given until they have become established.

Staking perennial flowers: Pæonies, Delphiniums, Lilies, etc.

It is important that supports be placed to these flowers before growth has advanced too far, otherwise much damage will result. The former kinds look best when staked with Hazel branches, but single sticks are preferable for Lilies, and if extra fine spikes of Delphiniums are desirable the growths should be thinned. The same applies to Herbaceous Phloxes.

The Alpine garden

All vacancies should have been made good ere this, but where positions have been reserved for choice dwarf annuals no time should be lost in getting these sown. A few choice subjects for this purpose include Platystemon californicus, Ionopsidium acaule, Sedum cœruleum, Felicia abyssinica, and Portulacas.

Chicory

This plant is in great demand during the winter months, and the present is the time to sow the seeds. The soil for this should be well prepared and in good heart, the seed sown in shallow drills at 14 inches apart. When the plants have reached about 3 inches in height they should be thinned to 6 inches apart.

Cucumbers and Melons

Many frames which have been used for the hardening off of bedding plants will shortly be available for other purposes, and may well be devoted to the above, plants of which should be prepared in readiness. The best results are obtained where a little bottom heat in the shape of fermenting manure or other material can be buried beneath the soil.

Trenches for Scarlet Runner Beans

These must now be prepared as for Celery, for although they will not be required for another fortnight it is advisable to have them in readiness beforehand and thus enable the newly moved soil to become weathered.

Fruit trees

Remove protecting material which has now served its purpose, in order that the trees may obtain their full benefit from air and sunshine. It may also be found necessary to give such trees a thorough soaking of water.

Strawberries

In some districts it is getting difficult to obtain straw for the protection of early-flowering varieties and for placing beneath the fruits, therefore I advise growers to get such material without delay so that no time is lost when it is needed.

Gooseberries

Keep a sharp look-out for the destructive caterpillar of the Magpie Moth on Gooseberries and Currants, and should its presence be located spray at once with Katakilla, the safest and finest insecticide one could possibly use for this pest. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Dahlias

It is a mistake to retain these too long in heated houses, as they get lanky and long-jointed, and therefore less able to withstand the check inevitably caused by planting out. As soon, therefore, as the plants get from 6 inches to 7 inches high have them transferred to cold frames, where they can get abundance of air during the day, and may be well matted up at night should frost threaten. In this way they can be gradually and properly hardened off for planting out early in June.

Pentstemons

These stately autumn-flowering plants are, of course, almost hardy, even here in the north, so if they have not been coddled during the last few weeks they may be set out in their flowering quarters. To have good results the ground should be fairly rich and well and deeply worked.

East Lothian Stocks

It is only by having these fine Stocks fit to plant before the middle of May that really good results are had. Rich, rather heavy loam suits this plant best, while the situation must be open and sunny. If growing in boxes or beds under a cold frame, considerable care in lifting the plants is desirable, so as to secure a good ball of earth around the roots. To this end give a thorough soaking of water the day previous to planting out.

Antirrhinums

These, if they have been hardily grown during the last few weeks, should also be in a fit state for setting out in their permanent quarters. This plant is not at all fastidious as to soil, but a sunny position is desirable.

Dwarf Beans

On retentive land it is risky to sow these yet, the seeds being very apt to rot should a wet spell set in. With light, open soils it is different, so a sowing may now be made on such.

Runner Beans

These are slightly hardier than the d sorts, although at times during cold, weather the seeds rot. It is, therefor good plan to plant twice or three times number of seeds necessary, and if gem tion is good the plants can be thinned 4 inches or 5 inches high. It pays to this Bean generous treatment.

Early Parsley

The plants raised in heat should no planted out. In gardens where this fails to do well a generous dressing of mould forked into the ground before p ing takes place will ensure a fine, he crop.

Onions

Box-raised plants may now be plante if this has not already been done. Sp sown beds should be thinned as soon as the plants can be handled. Choose sho weather for this operation if possible.

Early Leeks

The plants raised early in the year glass should now be planted out in prepared trenches. Should the weath dry give a good watering, and if there b sign of frost or drying winds afford a protection by laying a few Spruce bra over the trench.

Feeding Ferns

Plants that are pot-bound can be g benefited by systematic feeding with liquid-manure, clear soot-water, Ichthemic guano. The latter is easily pared, a dessertspoonful to a gallon of being a suitable strength at first. three may be used week about, and tw week is often enough at first, but late may be increased to three times weekly.

Pelargoniums

Given cool treatment and a regular s of weak liquid-manure (twice or thr week) all sections of this useful famil bloom over a long period and keep green and conservatory gay, while the double of the Zonal section are valuable a flowers.

Cinerarias

Prick off the seedlings into boxes of soil before they get too large. Cool ment and shade from all bright sunshi the main essentials to success with this Earlier batches should be potted off a in a shady frame.

Herbaceous Calceolarias

A little gentle feeding will greatly these showy subjects. Keep free of Fly by periodic vaporisings with ni To produce plants for next year's blo seed may now be sown. A cold frame a north wall is the best place for the pans.

Primula malacoides

Seeds sown now will produce plant will succeed better, as a rule, than raised earlier. Cool treatment is de and very careful watering, damp bei chief enemy of this pretty little Primros

Tomatoes

These are now setting freely, and ver feeding must be resorted to. While manure is excellent, quite as good resu had by the judicious use of artificial lants. By giving light dressings of about once every three weeks good follow and considerable time is saved.

hey are well called "Sweet Rockets."
old garden were many delightful
t Side by side with the double white
s were clumps of Dielytra spectabilis,
nk and crystal lyre-shaped blossoms
from the gracefully arching stems,
old Pansies, Musk and Monkey-
, Roses and Potentillas, and Blue-
larys all were there.

Nowadays the old Sweet Rockets do not seem to adapt themselves so graciously to their surroundings. Whether they are given the same treatment as in the old garden is doubtful. It is well to keep young plants on hand ready to fill up gaps should such occur. These may be propagated by offshoots or cuttings. The soil must be rich, stiff, and calcareous. Withered blooms should be removed.

The purple variety of double Rocket has become even more scarce than the white. It is a most desirable plant for the early summer herbaceous border. Sometimes these double Rockets do exceedingly well, and it is quite possible, with more or less trouble, to coax them into their great beauty. E. A.

Pyrethrums

Pyrethrums are of extremely easy culture, and grow freely in most garden soils. There are many varieties, single and double, and being varied in fine colours they deserve to be well cultivated. The habit of the plants is compact when in bloom, ranging from 18 inches to 24 inches in height, and forming pyramids of flowers. In all kinds the flowers are carried erect on stiff stems well above the foliage, and the flowers are abundant. The single section usually exhibits a taller and a looser growth, and should be placed in the border behind a plant of more lowly stature.

From Gardening Illustrated

Fifty Years Ago

Mother of Thousands

THIS fine old plant . . . was at one time only to be found in the cottage window. It is, however, very suitable for hanging-baskets and other situations for which its pendent tresses render it valuable. It is particularly free flowering, and the flowers, which are borne on large branching panicles, are light and graceful. Its leaves, which are dark green, are prettily mottled with white, and the plant sustains little or no injury from room cultivation. One peculiarity which increases its beauty, and which makes it so precious for hanging-baskets, is its long, reddish, thread-like runners, here and there furnished with little rosettes of leaves or plantlets. . . . Thus we have masses of delicate white flowers rising above the green-and white foliage, and below a shower of silky red runners. . . .

As old plants do not bloom so long as young ones, occasional replanting is desirable. March and April is undoubtedly the best time to plant, just as they are commencing growth. Autumn planting should always be avoided. Even in light sandy soils a wet winter will ruin autumn-planted stuff. July planting is often advocated, soon after the plants have flowers, and, providing the plants receive proper care and attention as regards watering, there is no reason why Pyrethrums moved in July should not prove successful.

Though Pyrethrums are in their fullest beauty in June they are seldom altogether flowerless throughout the summer, and healthy clumps will give a good percentage of bloom in autumn when most needed.

Many of them are equally at home in a thin shrub border as in the herbaceous border. Sun, indeed, is probably the first essential to success with the Pyrethrums, an absolutely open and even exposed spot suiting them best, and a light, but fairly rich, sandy loam on the dry side. Lime or old mortar rubble may be mixed with the soil to make up a good rooting medium. The chief enemy in the form of garden pests is the slug, which shows a decided liking for the young shoots. By placing around the plant a good handful of lime, however, this pest is overcome.

I append a list of varieties:—Double varieties: White Queen, pure white; Queen Mary, deep pink; Pirle, rose pink; Lady Derby, pale pink; Wiga, yellow and pink; Excelsior, pink and cream; J. N. Twerdy, crimson and gold; Yvonne Cayeux, primrose; and Dainty Queen, pale pink and cream. Single varieties: James Kelway, deep red; Harold Robinson, rich crimson; Mrs. Bateman Brown, velvety crimson; Margaret Moore, soft pink; Agnes Mary Kelway, rose; H. M. Stanley, bright crimson; Snow White, pink to white; Princess of Wales, soft pink; and Aurora, creamy pink.

H. Stevens.

Anomatheca cruenta

Although introduced from the Cape of Good Hope nearly a century ago, this remarkably bright little bulbous Irid does not appear to be very widely grown. This may be due to the fact that its complete hardiness is doubted, but even if the plant has to be treated as a half-hardy bulb, it is worthy of the attention of the grower, for its dwarf stature, carmine-crimson colour, free-flowering habit, and long period of display combine to make it a most useful border plant. Probably its hardiness depends more on soil and position than on actual temperatures, for on warm borders in well-drained and sandy soil it grows with remarkable freedom, and increases rapidly if left undisturbed for two or three years. The bulbs are somewhat small, and should not be planted at too great a depth. In a light sandy soil from 3 inches to 4 inches would be suitable, but on heavy types of soil from 2 inches to 3 inches is sufficient. Where the natural soil is of a very retentive nature, however, it is advisable to remove several inches from the surface and replace it with light, gritty material which should be worked as much as possible into that remaining. A narrow border in a sheltered position, well drained, and so treated, becomes a warm border, and permanent planting may be practised with success. W. Auton.

Violets

Young runners are now breaking freely from the plants, and from these the best Violets are raised. These runners on unkindly soils do not take hold freely, and where this is the case, and a large stock has to be raised, turn these runners into cuttings early and get them well-rooted in frames. Cut them off about 3 inches long, if possible with a little root, and dibble them into a bed of rich soil in a frame. Keep the latter rather close for two or three weeks while the cuttings are rooting. Then gradually inure them to plenty of air, harden off for two or three weeks in the open air by removing the lights and then plant out.

They should be given a partially-shaded position on light, warm soils, such as the shadow of a wall or building for part of the day, but not beneath the drip of trees. Where the soil is heavy the bed must be specially prepared by digging in leaf mould or old potting soil. Violets are hearty feeders, and delight in plenty of well-decayed manure. Some growers favour a good dressing of lime. F. H.

Coleus thyrsoides

Coleus thyrsoides is a beautiful winter-flowering greenhouse plant, and one that is exceedingly useful, either in the conservatory or for house and table decoration, coming into bloom at a time when flowering plants are most valuable. This species is a native of British Central Africa, and was introduced during the latter part of last century. It flowered at Kew for the first time in 1898. Its beautiful blue flowers are produced in comparatively long and somewhat loose racemes, in pleasing contrast to the pubescent stems and pale green foliage. Well-grown plants are especially decorative, and when displayed in groups of several together, they present a splendid ornamental effect. The plants make fine specimens, attaining a height of from 2 feet to 3 feet.

This Coleus is by no means difficult to grow; ordinary greenhouse treatment suits it admirably. Propagation is effected by means of cuttings, April and May being quite soon enough to put them in. These should be inserted singly in small pots, and placed in a warm propagating case until rooted, transferring them later to 4-inch pots. When thoroughly established they may be grown on in an ordinary greenhouse temperature, and kept shaded during the hottest part of the day.

This species grows very rapidly, and it is also a gross feeding plant, consequently it should have plenty of root room in order to develop properly. If extra large specimens are desired, pots 8 inches or 9 inches in diameter will be none too large. Small plants for house or table decoration may be rooted later in the season, in June or July; these will make nice useful plants for the purpose mentioned. They will thrive in a compost consisting of fibrous loam, leaf-soil, decayed manure, and sand in suitable proportions. When the plants are established and have made plenty of roots, they require to be liberally fed, and will receive considerable benefit from occasional applications of liquid manure or soot water. The plants should receive cool treatment throughout, and a night temperature of 50 degs. is sufficient at any period of their growth. It may also be added that the plants continue in flower for a long time during the winter. J. L.

Specimen Cinerarias

The Cineraria of to-day must be classed as one of our most indispensable decorative plants for spring flowering under glass. Their cultivation is simple, and to secure plants a yard high and as much through calls for no special skill. But we must employ the Star variety (C. stellata), which, by its habit, lends itself to treatment.

The seed should be sown thinly in a shallow, well-drained pan containing a mixture of peat, loam, and sand. After watering, cover the pan with paper to ensure quick germination and the seedlings will be up in about 10 days. Remove the pan now to a shelf near the glass and shade from strong sun, applying water when necessary by immersing the pan in a tub of water. When the plants are in the rough leaf prick them out in similar soil about 2 inches apart and again return to the shelf.

In due course shift the plants into 4-inch pots, using a compost of two parts fibrous loam to one of sand and leaf-mould, and when the plants have recovered from the shift remove them to a cold frame, standing the pots on a hard ash bottom.

When growth is a little more advanced and the centre stem about 4 inches high nip out the growing point. This causes the plant to break, and from this break we may expect from four to six side shoots. Another shift is now necessary, this time into 6-inch or 7-inch pots, using two parts good chopped loam, one of leaf-mould, and one of old decomposed manure. Arrange the plants again in the cold frame or pit and see that the foliage of each is quite clear. When the shoots which result from the first pinching are about 4 inches or 5 inches long pinch them again and this will be all the pinching required. For the final potting into 9-inch or 10-inch pots the best compost to use is two parts of chopped loam, one of dried cow manure passed through a ¼-inch sieve, one of good leaf-soil, plenty of sharp sand to keep the compost open, and a dash of soot. Pot fairly firm, stake out the shoots neatly, and growth onwards will be both luxurious and strong.

Cinerarias revel in moisture, so vigorous syringing each evening should not be neglected. As a preventative against Green Fly syringe the foliage with XL All or other insecticide in the evening. This makes the foliage bitter and prevents attacks.

D. M. F.

Kalosanthes (Crassulas)

Unless a flower is useful for cutting, it does not have a large following of growers to-day, and even amongst owners of greenhouses this prejudice often obtains. Kalosanthes are examples, yet who can say that these miniature monkey-puzzle-like plants are not attractive when the points of the shoots are carrying their brilliant red flowers? It is rather unfortunate that Kalosanthes should be regarded with indifference by so many owners of greenhouses, because they are not difficult to deal with, provided they are given a compost made up of three parts peat, one part loam, with a little ground charcoal added. They delight best in a warm, humid atmosphere, but in a house where miscellaneous subjects are grown and kept free from frost, there they will thrive. Propagation is effected by cuttings from ripe shoots, removing two pairs of bottom leaves before placing them in pans of the compost named to which silver sand is added.

MIDLANDER.

Toads in the garden

A toad is a useful pet in the yard or in the garden. Not that you can teach a toad to do tricks or anything like that, but, in a measure, it can be tamed so that it becomes accustomed to people and to human voices and other domestic noises. Contrary to an old-time belief, handling toads will not cause warts on the hands; the warts remain on the toad, where they belong.

A toad's unselfishness lies in its almost insatiable appetite for insects. It is stated upon good authority that one toad, in the course of three months' time, will devour almost 10,000 insects, including worms, slugs, beetles, flies, mosquitoes, crickets, cutworms, plant lice, and other more or less destructive pests.

In order to thrive toads must have moisture, so it becomes necessary often to provide a shallow basin or pool of water in which they can soak their bodies in comfort; for that is their method of quenching their thirst. They are long lived. One was known to live thirty-six years, and then lose its life by accident.

Toads are warty and cold, but not slimy, as some people think. The temperature of their bodies is governed by the temperature of the air. As a means of defence they are able to throw off from their warty skins a fluid which is extremely irritating to the mouths of dogs and certain other animals The fluid does not irritate human skin unless it is communicated to the membranes of the mouth or to the eyes. German violinists
said to use it on their hands sometime
prevent perspiration. The toad has bri
shining, beautiful eyes. It has a ca
interesting way of "playing possum" w
frightened by flattening itself against
ground, which it resembles in colour,
ceasing to breathe for a time.

"BETTER FLOWERS

Border Chrysanthemums

Early Summer Pests

ONE of the most important items w
leads to ultimate success with Bo
Chrysanthemums is to keep the pl
clean and healthy throughout their e
growing period. During early summer
two pests which are liable to give rise to
trouble are the Leaf-mining Maggot
Aphides, or Green Fly. In connection
the former, there is no doubt that w
possible it is good practice to comm
operations before the plants are removed
doors. The small flies which are resp
ble for the trouble seek the shelter of
greenhouse for the winter, and in early sp
deposit their eggs in the leaves of cut
and young plants. By fumigating tw
three times with auto-shreds the flies
killed, and, furthermore, it is claimed
this preparation is capable of destroying
egg in the leaf. If allowed to remain
disturbed the egg eventully hatches out
a small maggot, the presence of whi
indicated by an irregular, discoloured li
the surface of the leaf. This is the resu
the leaf-miner eating its way along bet
the upper and under protecting surfac
the leaf, the maggot itself being locat
the end of the line. In cases of mild a
the culprit can be pinched between the
and the thumb-nail, or removed from
under-side of the leaf by means of a pin
sharp-pointed knife. If the leaf is se
disfigured it is better transferred from
plant to the fire. Occasional syringing
watering with dilute soot-water ten
make the leaves bitter and distasteful,
spraying solution which contains an el
of paraffin keeps away the fly when lo
for a suitable place in which to lay its eg

up the stomata or breathing pores.
are many commercial preparations to b
which prove efficacious against this pes
quite a useful one can be easily made by
ing 1 lb. of soft-soap in 2 pints of
Whilst actually boiling, this is poured
suitable receptacle containing ½ pint o
affin, and the whole is thoroughly mix
well-worked with a syringe. Careful m
is necessary so that no free paraffin is
the solution, otherwise damage to the
anthemum leaves would result. Half
of the mixture diluted to fill a 2-
watering-can is sufficiently strong and s
be applied by means of a syringe which
a very fine spray. Attention should b
to the under-side of the leaves, and pa
larly to the growing-point of the plan
tender nature of which proves very attr
to the Aphides. Owing to the fact that
pests breathe through pores on the surf
their bodies the covering made by the f
soap interferes with respiration and
about death. A further spraying with
water some time later serves to rid the
of the dead insects, and to wash the sp
solution off the leaves. Aphides multipl
amazing rapidity in a very short spa
time. Periodical sprayings must oft
undertaken in order to keep the pest
paratively harmless.

[It is just possible that the bulbs of the kinds you mention are not planted as deep as they should be, and to assist them we advise a dressing of good top soil, to which has been added crushed bones. This may be applied now at the rate of 7 lbs. of bone meal to each bushel of soil, the soil being placed over the roots to a depth of 1 inch at least.]

GREENHOUSE

Diseased Violets

(H. P. T.).—We have examined your specimen Violet plant and find that it has been attacked by a fungus, probably Botrytis. Species of Botrytis are often saprophyte in habits, but some of them are always liable to become parasitic and cause much trouble to the plant lover. Violets are often difficult to winter in frames, especially if planted from the open into the frames late in the year. Violets should be put into the frames and allowed to recover from the effects of moving long before there is any need to put on the frame lights. The lights should be taken off on all favourable occasions, and, in the main, the lights must be used to keep heavy rain away rather than to keep the plants warm. Exception to this is, of course, during a period of frost, during which the lights must remain on and covered with mats, if necessary. Plenty of air and not too much moisture in the atmosphere of the Violet frames are essentials to success. If the trouble appears in your frames another year, dust a little Flowers of Sulphur about the plants.

Azaleas and Chrysanthemums dying

Can you tell me what is wrong with enclosed plants ? The smaller piece of Azalea is off a plant that looked when in flower as if it would shrivel and die, and now the whole plant is as enclosed; the larger piece is of another plant that bloomed freely and looked perfectly healthy; when it had done flowering it withered, and is all over as enclosed. Are they beyond redemption, and if not, what is the treatment and the cause? The Chrysanthemum cutting was in a different greenhouse and has been moved to a cool frame, and you can see it is withering. Much larger plants are also losing their leaves by turning yellow.

M. A. C.

[The shoots of the former were quite dead when received, and as there is no sign whatever of insect life upon them, the trouble is due to improper culture. You do not say whether the house in which they have been growing was heated during the winter, and if not, the plants have probably been frosted; if the house was heated, then the trouble is due to bad management, such as allowing the plants to become too dry, or overdosing them with artificial manure, either of which would bring them to their present state. We do not think there is the slightest hope of recovery, and we advise you to throw them away. The Chrysanthemum has damped off, a state of things brought about by the application of too much moisture at the roots and about the foliage during its cutting period. Place any other of its kind that you may have in a cold frame, standing the pots on a bed of ashes; air freely, but carefully, on fine days, and water the plants only when this is absolutely necessary.]

Geranium foliage

(Geo. Noble).—We have carefully examined your specimen Geranium and cannot find any trace of fungus disease or insect pest present; further, the roots are quite healthy. It appears to us likely that some error of cultivation is responsible for the spotted foliage. Water collecting on the foliage and the sun shining through the drops is a likely cause; this could be prevented by airing the house a little more freely. Of course, there are many things which cause the trouble. Fumes from a lamp, stokehole, or an overdose of fumigants are frequent offenders in this respect.

TREES AND SHRUBS

Douglas Pine

(James Ridley).—The specimen shoot of Douglas Pine is covered with the egg stage of Chermes Cooleyi. This creature is a serious pest of the Douglas Fir, and much depends upon the size of the tree as to whether or no you can adopt control measures. If the tree is large spraying will be impossible, but if you can reach the tree with a spray fluid you should be able to save the tree. A good spray fluid can be made as follows: Paraffin, 2 pints; soft soap, 1 lb.; water, 10 galls. Dissolve the soap in a gallon of boiling water, remove the solution from the fire and while hot add the paraffin. Churn the mixture by syringing the fluid back into itself. Finally, make up to 10 galls. with soft water and thoroughly churn again before use. A full account of this insect is contained in Bulletin, No. 4, of the Forestry Commission, obtainable from H.M Stationery Office, Adastral House, Kingsway, London, W.C. 2, price 2s. 1½d., post free. Please note that we do not reply to enquiries through the post.

Dying back of Yews

(A. H. Wolley Dod).—We have examined your specimens and can find no trace of a fungus. The trouble is, no doubt, due to the cold weather experienced during the winter. Evergreens are in the same condition throughout your district, and, in almost all cases, the damage is most apparent in one or two places. (1) On the sunny side; (2) where the prevailing wind has caught them. We notice in the specimens sent that the tips appear to be dead, and although we think that the shoots will break below the injured portion, the dead tips will be unsightly unless removed.

MISCELLANEOUS

Arsenite of copper

(J. E. B. Grasmere).—This substance is very poisonous and great care must be used in its application as an insecticide. We believe that it has been used as a poison wash for fruit trees and as a poison for slugs when mixed with bran. If Arsenic is required at all for horticultural insects it is usually used in the form of lead arsenate, because this material is equally as poisonous as the other arsenic compounds and is not so liable to burn foliage. Arsenite of copper is known in commerce as Scheele's Green, and is used in the Arts. Paris Green is another similar material used largely in the past as a poison wash for caterpillar, and still used for making poison baits for certain soil pests. You should write to the chemists whose names appear on the packets for directions as to its use, because the label only says "containing arsenite of copper," and as we do not know how much it contains we do not care to advise.

NAME OF PLANT

G. H.—Polyanthus too withered to identify.

CATALOGUES RECEIVED

Fred J. Bell, Crescent Nurseries and Egremont Nurseries, Whitley Bay.—Violas, Pansies, Chrysanthemums, and Collarette Dahlias.

Kelway and Son, Langport, Somerset.—Asters, Gaillardias, Lupins, Pyrethrums, and other hardy plants.

Forest Products, Ltd., Ross Road, Huntley, Glos.—Forest trees, Conifers, hardy and ornamental flowering trees and shrubs.

Report on condition of horticultural crops on April 25th

Asparagus.—Very backward.

Beans, Broad.—Autumn sown, badly damaged by frost. Spring sown, backward.

Beans (Kidney Runner).—Sowing in progress.

Broccoli, Heading.—Badly damaged by frost. Late varieties good in Cornwall, but elsewhere poor. Sprouting—Poor generally; much injured by severe weather.

Cabbage (spring sown).—Need rain. Autumn sown, badly frosted generally. Crops late and light.

Carrots.—Early sowing germinating well in some districts.

Celery.—Germination good; pricking out delayed by cold and drought.

Cucumbers (under glass).—Plants strong and healthy, but rather backward. Cutting begun in some places.

Leeks.—Fair generally.

Lettuce.—Wintered badly; spring sowings require rain and warmth.

Onions.—Autumn sown much damaged by frost; spring sown germinated fairly well, but progress very slow.

Peas.—Early sowings germinated well, on the whole, but growth is very slow.

Rhubarb.—Backward; requires rain.

Seakale.—Yielding fairly well in Middlesex.

Tomatoes (under glass).—Late, but making headway.

Apples.—Backward, but there is promise of a good show of blossom.

Cherries.—Good promise generally; early varieties now in full bloom. Damage by frost reported in some parts.

Currants, Black.—Promising generally.

Currants, Red.—Prospects good on the whole, but frost damage to early varieties is feared in some districts.

Gooseberries.—Flowering freely; frost injury reported to be fairly heavy in some parts.

Pears.—Blossom plentiful, but severe frost injury is feared in several places.

Plums.—Good show of blossom generally; frost damage feared in places.

Strawberries.—Damage by severe winter weather appears to have been very general, especially among older plants. Growth backward.

Delphinium Show

We have received from the British Delphinium Society the schedule for their First Summer Show of Delphiniums, to be held at the R.H.S. New Hall, Vincent Square, Westminster, on Friday, July 5th. There are 15 classes for Amateurs and seven for the Trade. Entries must reach the Asst. Hon. Secretary, A. J. Moir, 25, Burstow Road, Wimbledon, S.W. 20, by June 25th. The schedule contains several interesting articles on the culture and marketing of Delphiniums, by well-known authorities.

Gardens and literature

If we go back to antiquity we remember in Homer's Odyssey the famous palace of Alcinous, King of the Phæacians. Without the courtyard was the great garden, where grew tall trees blossoming, Pear trees, and Pomegranates, and Apple trees with bright fruit, and sweet Figs and Olives in their bloom. The fruit of these trees never perisheth, neither faileth, winter nor summer, enduring through all the year. There, too, are all manner of garden beds planted trimly that are perpetually fresh, and therein are two fountains of water. These were the splendid gifts of the gods in the palace of Alcinous.

The historian, however, has warned us that to mix together casual references in poets, such as Horace, Tibullus, Ovid, or Virgil, and to construct a picture of the average Roman villa out of these materials would be misleading. Still the growing love of the country farm and garden can be traced in Roman times. Thus we read of Pliny the younger that he was almost a collector of villas in different parts of Italy, and had two on Lake Como, the higher one "Tragedy," the lower "Comedy." He begins the determined choice by serious writers of the country not only for recreation, but for literary work. Further, it is recognised that the later gardens were all alike, modelled on the plan of Pliny's Tuscan villa, with a portico opening on the "xystus" or terrace, walls bordered with clipped Box, or Ilex hedges leading to grassy lawns adorned with fountains and marble seats. But as you follow the story of the Italian Renaissance gardens and the paintings which picture contemporary villa retreats it is a long succession which you find of Cypress and Pine, Ilex and Box in all sorts of geometric and fantastic designs, and on the whole a remarkable relative paucity of flowers.

Chaucer in England is the pioneer poet of birds and flowers in the fields and gardens, as when he sees the glory of the flowers and exclaims:—

'Farewell my boke, and my devocioun!"

It is delightful to read of the out-of-door gatherings in the shade of gardens of the Florentine humanists. Francesco Petrarcha, "the first modern man of letters," was also the first humanist gardener. In 1339 he constructed his "upper garden" at Vaucluse, on the left bank of the pool, "immediately below the cave of the source." Petrarch tells how he and the friend who assisted him found the task heavy toil, and how in the intervals "they laid their weary limbs on a knoll and discussed ancient literature, comparing the Greek and Latin poets." In a later letter he describes a second garden he has made close to his house, "better tended and beloved by Bacchus (that is, suited for Vines). Near it, at the back of the house, separated by a short bridge, is an arched recess in the natural rock which prevents my feeling the heat of the blazing sun. It is a place that invites to study, and I fancy it is not unlike the little chamber where Cicero was wont to declaim, except that the latter had not the Sorgues gliding past it." The Sorgues was the beloved stream. Here we get the main features of the literary man's country home, the house where he can receive friends, the garden and lawns, with shade against the heat of the sun, and the slope of the grounds towards a stream or river.

Boccaccio associated his stories with the
gardens of Poggio Gherardo and
Palmieri, near his home at Settignan
get the full atmosphere of nighti
broad alleys with pergolas of the Gra
fruit in blossoms, gay flowers, a
central white marble fountains. In R
the Abbey of Thelema was purposely
by the river Loire, within two leagu
great forest. There one rule was: "
que vouldras" ("Do just as you like"
of course, by the riverside was the fa
den of pleasure, and in the midst of
fair labyrinth. The glorious gardens
Medici helped to develop the philos
artists, and poets of Florence. So w
gardens of Este and the Gonzage
with the gardens of Papal Rome, t
dens of Venice.

Not only were the palaces of kin
mansions of nobles equipped with g
where literary men were encouraged
and discuss books, but churches and
had their orchards and gardens, and
ful college gardens and lawns were
the institutional provision.

Although our climate has not offe
same advantages, England has joined
connection of gardens with lit
Shakespeare's garden is recalled. It
Sir Thomas More's garden at Chels
an outlying country district, that the
ful gatherings of English literary m
place. Ellis Heywood, in "Il Mor
of the famous dialogues. "Six ge
after having dined with Thomas, as
mound which rose in the garden
host and seated themselves on a gre
shaded by some spreading trees, and
conversation. . . . The slope of the
was adorned with flowers and fine h
seemed an enchanted garden with
woven by Nature to recreate the phil
who came there for rest."

In conclusion, these joys have ne
more classically described than by
Milton in "l'Allegro" and in "Il Pen
the quiet pleasure of

The effect of Fisons' Champion Fertilizer on Beans. Untreated pot on left; treated pot on right.

By Appointment.

FISONS' FERTILIZERS

Will Increase the Yield of Your Garden

A SMALL outlay on Fisons' Fertilizers will enable your crops to be increased greatly, blooms improved, and the season extended.

It is most important when feeding Flowers and Vegetables to use perfectly blended, properly proportioned foods. This is secured by using Fisons' Fertilizers.

Expert advice is at all times available, free of charge.

FISONS'
CHAMPION FERTILIZER
for Potatoes and Vegetables.

Dig in 6 ounces to the square yard or 11 lbs. per rod when preparing the ground. Vegetable crops, particularly potatoes, respond so readily to this Fertilizer that the increased yield more than repays the cost of the Fertilizer. Full instructions sent with each bag.

PRICES IN BAGS:	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt.
Carriage paid	**3/-**	**4/6**	**7/-**	**12/6**	**19/-**

FISONS'
CANARY GUANO
(A Compound Fertilizer).

The best Fertilizer for general use on Flowers, Fruit, Shrubs, and Pot Plants. Highly concentrated, and therefore economical. Safe to use. Apply in open weather to herbaceous borders. Hoe in 4 ounces to the square yard.

PRICES IN BAGS:	7 lbs.	14 lbs.	28 lbs.	56 lbs.	1 cwt
Carriage paid	**3/-**	**5/-**	**9/-**	**16/-**	**26/6**

WINTER OF OUR DISCONTENT, THE 309

The Winter of Our Discontent

By Sir Arthur Hort

last we have had it, that "old
hioned winter," and, in many dis-
ts, at least, it has been followed, not
warm showers which might have re-
any plants desiccated by frost, but
h winds, continued frosts, drought,
levastating sun. One may feel half
d to complain of sunshine, yet the
r knows how destructive it may be
ntempered by seasonable rain, and
anied instead by
g winds from east
th. It is, of course,
r yet to estimate fully
s in the garden; but
judent horticulturist
ake, at least, pro-
observations and try
by them; they may
him a wiser, if a
man. But he will
at the other side of
ure, and may find
ough his plot shows
vacant tenements,
umber of things have
l surprisingly from
e British experience
lmost absolutely dry

subjoined notes from
l North Hampshire
r may interest some,
haps induce them to
tes for comparison.
den in question has
l sub-soil, and most of
a steep slope, facing
y no means enviable
ns when, after one of
erage mild winters,
ome up too early and
by the average fierce
The record of the
ust past (or passing)
nplete contrast; there
n frost, except for an
al respite of two or
days, almost every
om the last week of November to the
writing (April 25th); the lowest tem-
reached has been 6 degs. Fahr.
from the ground, and the reading
cen between 10 degs. Fahr. and 22
ahr. In this period there has been no
ond occasional showers (half an inch
hristmas), and only one slight fall of
. Such an experience should be useful
ing plants introduced since our last
nter, whose hardiness in our climate has not yet had the opportunity of getting certificated—or otherwise.

Sir Arthur Hort's garden at Hurstbourne Tarrant, Hants, from a photograph taken in June

(A) Shrubs.—(1) Not damaged, or but slightly: Abelia Schumannii, Atriplex Halimus, Buddleia alternifolia, Carpenteria californica, Caryopteris glutinosa, Fabiana imbricata, Nandina domestica, Osmanthus Forrestii, Romneya hybrida—cut to the ground, as always; in most English gardens the Romneyas are practically "herbaceous"; the same remarks apply to Phygelius capensis and Teucrium fruticans.

(2) Dead, or badly crippled: Azara microphylla (on west wall), Olearia avicennæfolia, O. Gunniana, O. macrodonta, Glasnevin var., Pittosporum tenuifolium.

(3) A mixed record: Choisya ternata, much browned, but should recover. Cistus corbariensis and C. laurifolius the only kinds with a clean bill of health; Silver Pink, slightly touched, one or two plants killed. Most specimens of all other kinds killed, except in the topmost bank of the garden, where albidus, monspeliensis, and recognitus survive; Clusii, creticus, cyprius, florentinus, lusitanicus, obtusifolius, purpureus, and salvifolius have mostly gone on the bonfire, but a few plants of these have escaped, having had boughs of evergreens stuck round to shade them. Escallonia macrantha cut back more than usual, if not killed, but E. langleyensis quite hearty. Helianthemum.—The species alpestre, alyssoides, lunulatum, polifolium, vulgare Mt. Cenis form, and even umbellatum, also those called Chamæcistus and pilosum, have taken no hurt; while some garden forms are killed entirely, and more hopelessly disfigured; of the group now classed under Halimium, formosum, reputed very hardy, is dead, also its var. unicolor, while one plant of halimifolium has escaped. (This group, it should be added, seems not to be at home on chalk.) Hypericum.—Shrubby species, such as androsæmum, patulum Henryi, and chinense, cut far back; of smaller kinds, empetrifolium and polyphyllum (name doubtful) killed, but not Coris, nor all plants of balearicum and olympicum; fragile, old, and seedling plants killed, not middle-aged ones. Pentstemon (small shrubby kinds), confertus, cristatus, Davidsonii, and Scouleri unhurt; Roezlii and "Six Hills" crippled, if not dead. Potentilla.—Of the many forms of fruticosa one bush of Farreri much damaged, and a New Jersey form; all others, including Beesiana, dahurica, Veitchii, and Vilmoriniana, intact. Veronica.—A pretty clean sweep of most New Zealanders, not only the tenderer, broad-leaved ones, but even Autumn Glory, Aoira, and Warley seedling (never wiped out before), as well as most plants of the small sorts, "Bidwellii," Daubenyi, catarractæ, and Lyallii; those of pinguifolia type less affected, and cupressoides not at all; Hulkeana and Girdwoodiana dead, of course. Viburnum.—The four Far Eastern species, Carlesii,

fragrans, Henryi, and rhytidophyllum, receive a further certificate of hardiness. Rose species.—Indica heavily punished, but other bush Roses, including ferox, Hugonis, Moyesii, lutea Austrian Yellow and Austrian Copper, rubrifolia, Sapphirinii, and Webbiana, in excellent health. Mermaid and sinica Anemone (both regarded as rather doubtful subjects) little hurt.

(B) Herbaceous Plants.—Tale not yet complete. Meanwhile, whether from frost or drought, the Primula and Geum tribes have had a specially bad time. Of Iris species (crested group), Milesii, gracilipes, and, probably, japonica have "gone west"; tectorum, however, only in one place, where it ought to have been divided and re-planted. Bearded Irises, in general, look better than for years past; beardless kinds, *e.g.*, Spuria and Sibirica groups, are shouting for water. Californians have abandoned their quasi-evergreen habit, but seem none the worse. So, too, of Linums, austriacum, narbonense, and salsoloides have lost more "top" than usual; flavum and capitatum are rejoicing; monogynum is dead. Other lovers of dryness, which look all the better for the season, are Tulips and herbaceous Veronicas of dwarf or sessile habit, such as Allionii, caucasica, cinerea, gentianoides, incana, rupestris, spicata, pectinata, Royal Blue, and True Blue (can anyone tell me the origin of the last two azure splendours?), and Anemone Pulsatilla has been in incomparable form.

These jottings were written before I had seen Sir William Lawrence's interesting review of the situation.

Arthur F. Hort.

Chelsea Show, 1929

The Chelsea Show will be held on Wednesday, Thursday, and Friday, May 22nd, 23rd, and 24th. On the first day, Wednesday, May 22nd, there will be a private view for Fellows and their friends from 8 a.m. to 12 noon, and on Thursday, May 23rd, from 8 a.m. to 10 a.m. Only Fellows' and Associates' tickets will admit at the private view, but transferable as well as non-transferable tickets may be used. There will be no admission by payment on Wednesday, May 22nd, until 12 noon, and on Thursday, May 23rd, until 10 a.m., when the Show will be opened to the public. The following instructions are issued by the Society:—

Those who propose to submit new or rare plants to the Committees for certificate should note that the Committees will meet on Tuesday, May 21st; the Joint Iris Committee at 4.30 p.m., and the Fruit and Vegetable, Floral A and B, Orchid and Narcissus, and Tulip Committees at 5 p.m. All plants, etc., for certificate must be entered with the Secretaries of the respective Committees by 4 p.m., new Bearded Irises being entered with the Secretary of the Joint Iris Committee by 3.30 p.m. The Secretaries of the Committees will be in attendance to receive entries from 10 a.m. Exhibiting vans will not be admitted to the Show grounds on Tuesday, May 21st, after 2 p.m.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Primula pulverulenta, Bartley Strain

The note by "D. D. V." in your issue of May 4th is of interest. I, also, have not found this lovely strain as hardy as the ordinary Primula pulverulenta, and have lost both old and seedling plants more than once. In consequence, I have been endeavouring to learn the results obtained by other growers, and have found that these are most diverse. In some parts this strain appears to be less hardy than the type, but other growers, often quite near, had no difficulty in keeping the Bartley Strain even during this last severe winter. It does not appear to be entirely a question of soil or exposure, and, so far as I can understand, climate is not the determining factor. It is to be hoped that Mr. Dalrymple, to whom we are so much indebted for this lovely strain, will turn his attention to this question, as it is possible that he or some other raiser may be able to eliminate the cause of these losses by selection of seeds from individual plants which may have escaped where others have been lost.

A Primula Lover.

—— In answer to your correspondent, Mrs. Martineau, and "D. D. V.," I, as raiser, have *never* found my strain less hardy than the type. In the case of Mrs. Martineau's plants, I am inclined to think the position may be too wet and cold for them in a season like the past winter. In the case of "D. D. V.'s" plants I cannot say anything, but I find that a rather heavy, holding soil suits them best. I am on heavy clay, and this means deep digging and draining to avoid getting water-logged and stagnant in winter. I am sure that bad drainage accounts for more losses of these Primulas than anything else. Drought and lack of moisture weakens them during the growing season, and they are in no condition to withstand a wet and severe winter, especially if they have been planted out late. Perhaps "D. D. V." will let me know the conditions under which the plants were growing. As the Bartley Strain is pure pulverulenta blood right from start to finish it ought to have the same constitution as the type, which I have always found it to have.

G. H. Dalrymple.

The Nurseries, Bartley.

Amateurs at the Daffodil Show

I read with great interest in your issue of Saturday, 27th ult., my friend, Mr. Guy Wilson's article on Daffodils at the recent
show held in Vincent Square. It was
esting reading, as his articles always a
may I call your attention to the fact t
amateur side of the show seems to hav
entirely ignored. The great object
show is to encourage the amateur, and
as I can see no mention is made of any
exhibits shown by them. May I m
several well-known amateurs who are
of seedlings and who also have go
hibits, the Rev. Rollo Meyer, the R
Buncombe, Mr. John Arkwright, and
others whom I cannot remember
moment. I, myself, had some success
single bloom classes, where I got three

Compton Wyniates

A background of antiquity

COMPTON WYNIATES, one of the finest examples of unspoiled Tudor building, the family seat of the Compton family, the present head of which is Lord Northampton. The illustration indicates a background of antiquity with the most modern means of turf culture, the Atco Motor Mower, being used on the lawns. It is recorded that Henry VIII. frequently played skittles on this lawn. In this manner modernity plays its part in the beautification of the ancient. A. M.

The Acanthus

A reference (page 294) is made to the Acanthus in the last issue of GARDENING ILLUSTRATED. It is a beautiful plant in addition to its classical interest, and has been grown for many years in the herbaceous garden here, and seemed strong and well acclimatised. Last winter's frosts, however, seem to have completely killed it. This may not be strange, perhaps, as the Acanthus mollis, which grows rampantly in Rome, both in the Forum and on the Palatine, had its leaves frosted into complete pulp there this winter. D. A.

Scaleby Hall, Carlisle.

The Scotch Rocket

I wonder if " E. A.," on page 305, is referring to the true Scotch Rocket (Hesperis matronalis fl.-pl. alba) when he states that he has seen this plant with stems several feet high? This is a plant that I have grown for a long number of years, and have never seen it, at its best, exceed 2 feet to 2½ feet in height. There is a larger and coarser Rocket (the French) which is often 4 feet or 5 feet high, quite a good plant, but much inferior to the Scotch form. In " The English Flower Garden " Mr. William Robinson notes the fact of the two forms, and also states that there are two forms of the purple, one tall and the other, named Compactness, being of better habit and deeper in colour. I have only seen the latter, and it is, as " E. A." observes, even scarcer than the white form.

Notwithstanding the " Arctic " winter and spring here, I notice that the Rockets have come fairly well through it all, which leads one to conclude that excessive damp rather than cold is the main cause of loss where the plants are given proper attention.

I can endorse " E. A.'s " advice to annually propagate this plant, and although quite good results are had from division, much the finest plants are raised from cuttings. These latter, unfortunately, are not always easy to obtain, as the plant is so apt to throw up flower-spikes from every point. An excellent plan is to prevent a plant or two from flowering. To accomplish this nip out the flower-stems as soon as they appear, and secure all side shoots when about 3 inches long, taking each off with a " heal," and inserting firmly in pots or boxes of very sandy compost. The chief enemy of these cuttings is damp, and I have proved that it pays to set the pots of cuttings in a cool greenhouse until rooted, where they can be kept drier than is possible in a cold frame. A fairly rich, stiffish loam seems to be most to the liking of this Rocket.

C. BLAIR.

Preston House Gardens, Linlithgow.

Achillea Lewisii

While we are comparing notes on the plants which have survived or have been lost owing to the rigours of the past winter I shall be glad to hear from others how the charming hybrid, Achillea Lewisii, has fared with them. Much to my surprise I lost my plants of A. tomentosa one winter, and now the delightful plant of which this is one of the parents appears to have succumbed. I had a good plant in a low wall almost " cheek by jowl " with Cotyledon simplicifolia. The Cotyledon has stood the ordeal without, as the saying goes, " turning a hair."

S. ARNOTT.

An Azalea surprise

I should be very glad to know whether any of your readers have had a like experience to the following:—At Christmas I was presented with a very fine crimson Azalea, which I kept in my sitting-room. A hard frost three days afterwards destroyed the flowers, and although I removed it by degrees into a warmer temperature and gave it tepid water, nothing availed to revive the frosted blooms. Seeing it was hopeless, I pinched out each calyx and continued to tend the plant carefully, and in February was surprised to find crowns of fine, plump buds forming. I then stirred the surface of the soil and gave a half-teaspoonful of Clay's Fertiliser, and continued this treatment up to the present, when the plant is in full bloom again with finer Camellia-like flowers of a far richer colour and consistency. (Miss) F. Mordaunt.

Bournemouth West.

"Six of the best" Pears

Everything in connection with the Pear possesses an attraction to me, and I have read Mr. Burrell's note on the "Six" with much interest. The supreme test, of course, is that of flavour, and it is just here that the difficulty arises. The personal equation is always the deciding factor—the Pear which one man appreciates may be considered poor by another. Let me give an example. I have grown, I daresay, almost every Pear which is worth growing, as well as many which are not worth growing. How many will support me when I say, seriously, that I consider Louise Bonne of Jersey to be the best Pear? To me its vinous flavour and firm flesh appeal in a greater degree than any of the Beurré family. Next I place Winter Nelis, a morsel for a king; small, doubtless, but as we Scots say, "Guid gear gangs in wee buik."

My third string is Doyenne du Comice, its peculiar "new-milky" tang being most agreeable to the palate. Will anyone back me when I select Beurré Hardy for my fourth and Glou Morceau for my fifth of the "six best"? It is with much difficulty, indeed, that I select my sixth. Which shall it be? Marie Louise, Conference, Fertility, Thompson's (Van Mons)? One of them it must be. And I plump for Thompson's. But, as I have said, it is the preference of the individual which must, in the end, decide the matter. Other lovers of this fine fruit will be able to give a list of six equally meritorious Pears, and some will doubtless criticise my choice. They are welcome to do so. I shall be satisfied to abide faithful to my own "Six Best Pears." A Scottish Gardener.

Coleus thyrsoideus

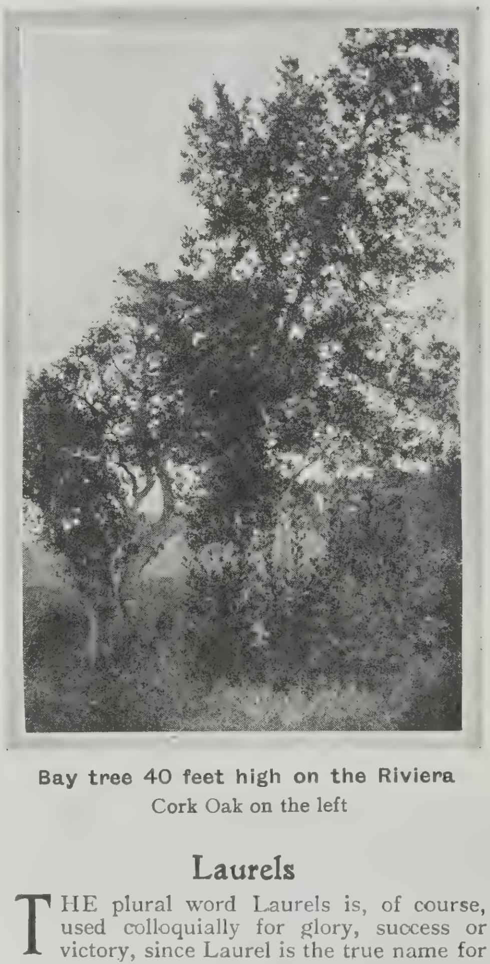
If, as "J. L." informs us (page 306), Coleus thyrsoideus was flowered at Kew for the first time in 1898, then I think I can claim to have flowered it at about the same date. The late Countess of Selkirk, to whom I was then gardener at Balmae, brought me, toward the close of last century, some cuttings of what she described as "a Coleus with blue flowers," and which had been given to her by the Dowager Lady Wynn at Llangedwyn. I distinctly remember that I grew them in a small span which was known as "Jubilee," owing to the fact that it was erected in 1897. The Coleus was C. thyrsoideus, and progeny of the original plants I continue to grow to this day. The plant, if not frequently pinched, is apt to become leggy, and its viscous foliage does not recommend it to some. Nevertheless, its fine spikes of cobalt-blue flowers come in very usefully at the close of the year. C. thyrsoideus is of the easiest possible culture, and while it does perfectly well under greenhouse conditions, I prefer to give it cool stove treatment. W. McGuffog.

Mabie, Dumfries.

Celery trenches

The note concerning the preparation of Celery trenches, in the issue of May 4th, reminds me that I invariably make a practice of making these trenches considerably in advance of this time. I find them useful auxiliaries to cold frames, and, moreover, they release the latter for other things. For example, young plants of Violas, transferred from beds in cold frames to the trenches, soon grow into large and massive plants, with the result that beds and borders can be furnished with fewer plants, and, what is more, the beds or borders more quickly assume an effective appearance. I consider that the extra work involved is amply repaid. Later on, too, seedling Asters, Marigolds, Stocks, what not, pricked off into the bottom of a Celery trench are practically secure from frost and quickly develop into sturdy plants. Boxes of other half-hardy annuals can be hardened off in the trenches, which can, by such devices, be made useful instead of being merely vacant ground for a month or two. Of course, early Lettuces, Cauliflowers, Carrots, Radishes, and Turnips are grown as catch crops on the ridges.

A Scottish Gardener.



Bay tree 40 feet high on the Riviera

Cork Oak on the left

Laurels

THE plural word Laurels is, of course, used colloquially for glory, success or victory, since Laurel is the true name for Bay-tree (Laurus nobilis), the foliage of which was used by the ancient Greeks and Romans as an emblem of victory, or distinction in poetry. We also use the term Laurels vaguely for various evergreens often gathered for decoration, especially at Christmas.

But there are half a dozen kinds of shrubs we English call Laurel. Living specimens of four of these were exhibited for some weeks at an important provincial museum. Nothing but their English and Latin names was, however, given on the labels; and to the uninitiated those specimens of Sweet Bay or Poets' Laurel, Common Laurel, Portugal Laurel, and Spotted Laurel might be closely allied plants, whereas only the second and third have any affinity except in their names.

The real Laurel, or Bay, is the aromatic shrub whose dark, green, narrow leaves are still used to flavour blanc-mange and pickled
mackerel. The French, in some things
practical than we are, call it Laurier,
its Latin name Laurus. Similarly, the
Colchicum "Colchique," while we

Lysimachias

genus Lysimachia comprises a con- le number of herbaceous species of ig habit, several of which are good plants, valuable both in the border he woodland garden. They are all of ulture and call for no special attention, ost of them thrive best in moist situations. L. barystachys is a plant of erect habit, its small white flowers being disposed in dense terminal racemes in June and July. L. clethroides is a rather taller growing plant, frequently reaching 3 feet in height; it also bears white, but much larger, flowers, which are disposed in terminal spikes, and present an attractive appearance. L. Fortunei is a useful late-flowering species, its drooping spikes of white flowers appearing in August and September, and its value is enhanced by its foliage turning a brilliant red in autumn. L. Henryi is a dwarf-growing species of comparatively recent introduction; it seldom exceeds 1 foot in height, and bears clusters of rich golden yellow flowers. L. punctata is also a yellow-flowered species of merit, its whorled leaves and flowers being produced on stout, erect stems which often reach a height of 3 feet.

Amongst our native species are two or three plants well worthy of mention. L. vulgaris, the common yellow Loosestrife, has erect, branching stems with bright yellow flowers in terminal, panicled cymes; L. thyrsiflora has also bright yellow flowers disposed in dense axillary racemes, and is a good plant for the moist, half shady glades of the woodland; while L. mummularia, the Moneywort or Creeping Jenny, is well known. A handsome trailing plant, excellent for carpeting or for hanging baskets, its opposite, roundish, glabrous leaves and large, solitary axillary flowers make an attractive display, while its golden-leaved variety presents a richness of hue in foliage which is a striking contrast to the more sombre hues of other plants.

W. AUTON.

After treatment of hardwooded plants

Failures with Azaleas, Heaths, Camellias, and other hardwooded plants, are sometimes attributed to a lack of water during summer, but in quite a number of instances among amateur gardeners, one has to go back several months for a true solution. Sometimes, after they have given of their best, they are hurried from a warm greenhouse to a cold frame to make room for other plants coming into bloom, or young seedlings being prepared for outside planting. Time must be given for the production of new growth and for its perfecting before any attempt is made to change their quarters. This means that for some weeks at least after plants have ceased to bloom, they should be kept within the warmth of the greenhouse, syringed to induce growth, and watered thoroughly when they need it, bearing in mind the close, retentive nature of the peat in which they are potted.

MIDLANDER.

Violas

Whether raised from seeds or cuttings, it is advisable to get these planted out as early as possible in order that they may get firm hold on the soil before hot and dry conditions prevail.

The Rhododendron Show

THE Fourth Annual Show of the Rhododendron Association was held in the New Horticultural Hall on April 30th and May 1st. The splendid display of flowers proved how well Rhododendrons had weathered the past severe winter. Severe frosts during the week previous to the show had in some districts, however, so damaged both flowers and buds that several exhibitors were unable to set up their customary groups, consequently the competition in the amateurs' section was not so keen as usual.

A good form of Rhododendron Augustinii, flowers clear mauve
Shown by Mr. Lionel de Rothschild

The class for a large group of Rhododendrons, plants or cut flowers, produced only two competitors. The first prize being awarded to Lionel de Rothschild, Esq. (gardener, Mr. A. Bedford), Exbury, Southampton, for a tastefully arranged group of the smaller flowered species, including R. Augustinii, R. ciliatum, R. ambiguim, Azalea Vaseyi, and many species of the Lapponicum series. The well-flowered and beautiful plants in this exhibit proved that what these species lack in size of flowers they make up in gracefulness; for it was certainly the most artistic group in the show.

Admiral A. H. Heneage-Vivian (gardener, Mr. K. Leith), Clyne Castle, Swansea, was awarded the second prize for a group composed entirely of cut flowers of large flowered species and hybrids. The magnificent trusses of R. niveum, R. Falconeri, R. Aucklandii, R. Thomsoni, and their hybrids made a very imposing group, but it was of that stolid beauty which seems inseparable with the grouping of masses of cut flowers of the large-leaved Rhododendrons; for no matter how carefully they are arranged, there is always a certain heaviness which gives a poor conception of the beauty of these same flowers when airily poised on the tips of the branches of a graceful bush, with the varying shadows of woodland or shaded garden as a background. It is only in this setting that one can fully realise how truly regal is their beauty, and how just their claim to be the Queen of Shrubs. For a smaller group of cut flowers, J. C. Williams, Esq. (gardener, Mr. W. Micheal), Caerhays Castle, Cornwall, was awarded first prize. His group contained R. floccigerum, R. tephropeplum, R. exeuticum, R. neriiflorum, and many other fine species, which deserved more artistic and careful staging. This group was also awarded the Amateur Challenge Cup.

Col. Stephenson Clarke (gardener, Mr. Fleming), Borde Hill, Sussex, was second, with a well arranged group of species and hybrids.

The Earl of Stair, Lochinch Castle, Wigtownshire, won the class for twelve trusses of distinct species.

Admiral Heneage-Vivian exhibited the best twelve hybrids.

The classes for single trusses were well contested, notable flowers exhibited in these were: The peerless species R. lacteum, shown by A. W. Williams, Esq., Werrington Castle, Cornwall, who also exhibited a wonderful blue hybrid between R. fastigiatum and R. Augustinii. R. Thomsoni x R. neriiflorum, shown by Sir John Ramsden, Bulstrode Park, Bucks. R. dichroanthum x R. neriiflorum, shown by J. B. Stevenson, Esq., Tower Court, Ascot. A fine pink form of R. adenopodum, shown by Gerald E. W. Loder, Wakehurst Place, Sussex. Azalea Weyrichii, shown by G. H. Johnstone, Esq., Trewethern, Cornwall; and a new species, K W 5438B, shown by Lady Aberconway, Bodnant, N. Wales. The trade groups were, as usual, very imposing. Messrs. Gill and Son's large first prize group was very impressive when viewed from the dias, for the large plants towered well above the other groups; the base, however, was perhaps rather too crowded with good things, and from the floor of the hall it looked rather crammed. The first prize group of Rhododendrons not in flower, exhibited by the same firm, was more tastefully arranged, and illustrated the decorative value of Rhododendrons even when devoid of flowers.

Messrs. Waterer, Sons, and Crisp were second in this class. Mr. W. Slocock put up a group of well-grown hardy Rhododendrons attractively arranged. A fine specimen of R. Dairymaid in this group was
awarded the special prize for the best
in the show.

Messrs. R. Veitch and Sons and M
Reuthe each exhibited meritorious gr
containing many good plants and
varieties.

The groups of Azaleas exhibited
Messrs. R. and G. Cuthbert and Mess
Cheal and Son, were each very bright
so attractive that the judges failed to diff
tiate between them, and they were aw
equal first prizes.

A new class for six vases of Rhododer
foliage was won by Lionel de Roths
Esq.; whilst Admiral Heneage-Vivian
awarded the first prize for a foliage R
dendron plant, his exhibit being a fine
of R. Falconeri.

There was keen competition for
Challenge Cup presented by Mr. Lion
Rothschild for the most meritorious e
of Rhododendrons. This was won
Messrs. R. Wallace and Co., Ltd., of
bridge Wells, who staged a magnificent
of hardy Rhododendrons in flower. A
variety of hybrids and species was inc
in this group, practically all of which we
comparatively recent introduction. On
variety, however, attracted conside
attention—a fine standard of R. G
Cunningham, an old hybrid which ha
been shown for many years. It has
shapely trusses of creamy-white, fre
with purple-brown. Among the
varieties Britannia stood out pre-em
among the scarlets; this is a very str
tone of brilliant scarlet-crimson. Of
reds we noticed Hugh Koster, a very
variety of Doncaster type, but with
larger flowers, in colour shining cri
Horsham, too, was very fine, with very
trusses of deep red flowers Of the
shades Betty Wormald was very fine,
enormous trusses of deep, flesh pink. R
W. Wallace also was an outstanding va
with bright, clear, pink flowers, though
what hard in tone, but nevertheless
showy. Pink Beauty is a fine delicate
without any spots or variation in
shading; and Louis Pasteur also attrac
good deal of attention, being very dis
with large compact trusses with fl
shading from a deep rose at the edg
almost white at the centre of each pip.
Lindsay Smith and Mrs. A. T. de la
were the only two pure white var
shown. Both of these are in the very
rank of hybrid Rhododendrons. They
enormous flowers and are very strong
ing. Mrs. A. T. de la Mare particularly
the eye on account of the delicate green
in the centre of each flower. This v
has the additional merit of fragrance, a
common characteristic among hybrid R
dendrons. Several fine plants of a str

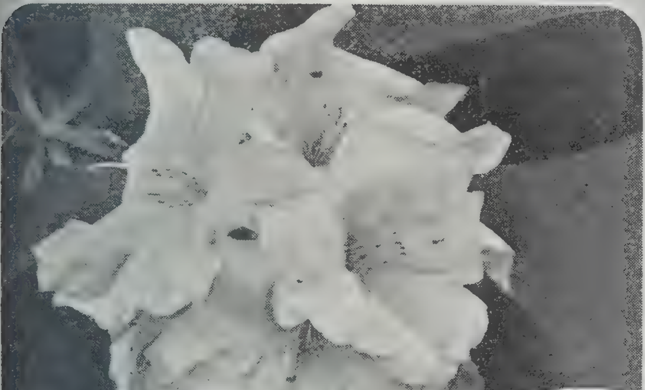
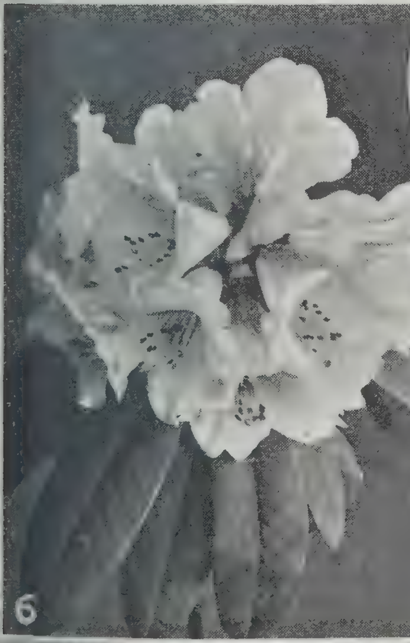
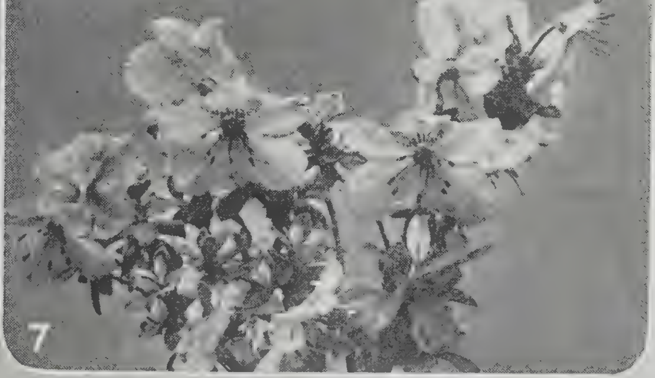
and the first prize for a group of







SEEN AT THE RHODODENDRON SHOW

. R. lacteum, one of the best species.

. R. Tyermanni, a tender species from Sumatra ; large, fleshy, pale flowers.

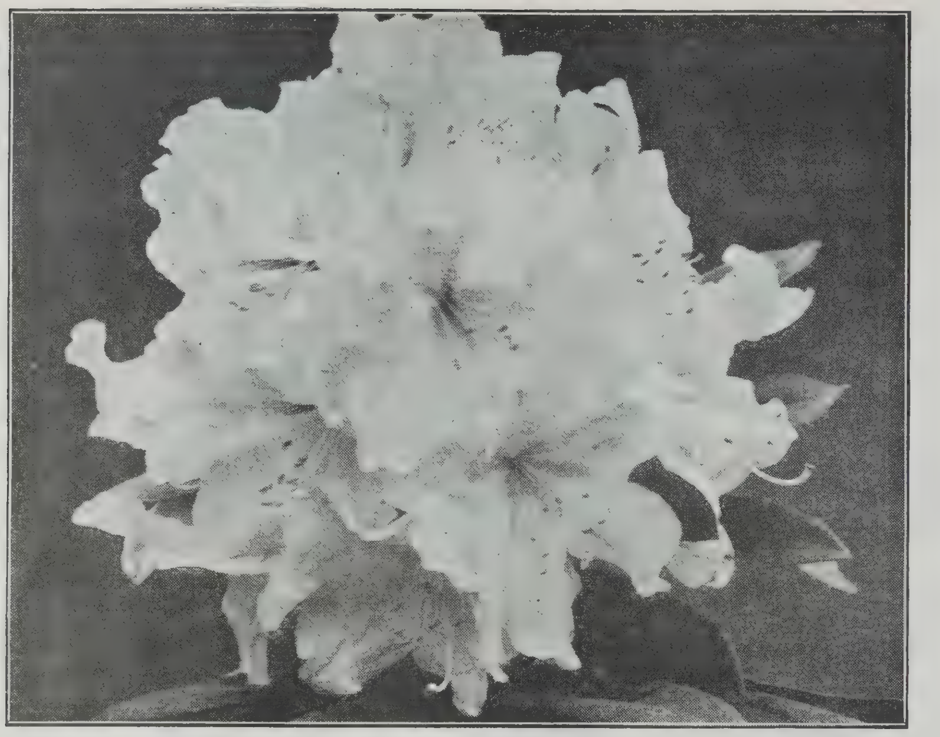
. R. Loderi King George, the finest of the hybrids.

. R. cinnabarinum, orange-red Lapageria-like flowers.

5. R. chartophyllum, flowers lavender colour, with protruding stamens.

6. R. Sutchuenense, one of the finest of the Chinese species.

7. The low-growing R. calostrotum, one of Farrer's introductions.



Rhododendron Mrs. Lindsay Smith, a beautiful truss of large white flowers
Shown by R. Wallace and Co.

Rhododendrons, Messrs. Wallace were also awarded the first prize for six cut trusses of hardy Rhododendrons, the varieties shown being Britannia, Mrs. Lindsay Smith, Horsham, Countess of Athlone (deep mauve), Brabantia (rich rose), and Mrs. George Leak (pink with a chocolate blotch). These last two varieties were shown for the first time.

Hydrangeas in pots

HYDRANGEA HORTENSIS adds much to the attraction of the greenhouse. There has been such great improvement in these plants of late years that it is difficult to associate the blooms of the modern varieties with those that flower in gardens in warm districts. Pink varieties are the most numerous, and it is in these perhaps the greatest variation is to be found. Almost every tone is to be noticed until almost a red is seen in one or two instances. Then there are the pure whites and creams. Blue is the colour that many aim at, but it is still elusive although there are signs of its becoming more fixed. Many a grower has been disappointed with this colour; he will perhaps obtain a cutting from a plant with blue flowers, and it is just as likely its flowers the next year will be pink

There is no doubt that soil largely influences the results, and where there is a lot of iron in it, there blue is most plentiful. Here in this red soil of Devon blue is most plentiful, from the lightest shade to almost a Delphinium blue. And yet in the next garden perhaps, and a similar soil, the huge bushes will carry nothing but pink flowers.

The easiest way is to plentifully mix iron filings with the soil when potting; also to water from early spring until the flowers open with water containing odd pieces of rusty iron. Then, again, the desired result may be brought about by dissolving 1 oz. of alum in a gallon of water, giving a dose of the solution to the plants twice a week until the flowers open.

The most popular form of plant is that in the 5-in. pot, carrying one fine head of bloom. Plants of this kind are not at all difficult to obtain, and to obtain a succession, propagation should be carried out from June into August. When the old plants have done flowering, stand them in the open, and after a fortnight the young wood will have hardened and will root much better.

The shoots selected for cuttings should be about 3 inches long, cut just below a joint, retaining all the leaves but the very lowest. Insert them singly in small pots filled with sandy soil and water them well. Placed in a propagating case on the greenhouse stage they will soon root, but they must be shaded from strong sun. The foliage will quickly indicate when roots have formed, and air should be gradually admitted until the plants are fully exposed, without flagging, to the atmosphere of the structure. The young plants will still need shading from strong sun, and progress will be hastened if the surroundings are kept moist and the leaves sprayed occasionally There must be no overwatering. Shading should be dispensed with as root action increases, and the plants exposed to as much light and air as possible, to prepare them for shifting on into 5-inch or 6-inch pots.

Hydrangeas are of luxuriant growth and delight in a light, rich compost of three-parts loam, one-part rotted manure, some coarse sand, and a little bone meal. The pots must be well drained. Place the plants in the coolest end of the greenhouse for the winter, and give very little water. With the turn of the year the buds begin to swell, and if a few are placed in a warmer position a longer flowering period will be obtained. As the sun becomes more powerful, more water will be required, with liquid manure twice a week.

Directly the flowers fade, cut back the stem to the first pair of strong leaves and grow them on during the summer. From three to five shoots will form, each of which will carry a flower next spring. Repot the plants in autumn, just slightly reducing the ball and give a slightly larger pot. Fine specimens may be grown in tubs for the summer garden, to stand on terraces or sunk in turf on the edge of the lawn. The plants will live for many years if they are surfaced fresh soil in spring, fed with liquid m during growth, and stored in a frost shed during winter.

The following are a few fine varieti White: Mme. Moulliere, Niege Orlea and Germaine Moulliere. Pink: Gu Kremhild, Professor de Dois, and Rhin Blue: La Marne, Mme. Truffaut, and Chambard.

F.

Kalosanthes

Kalosanthes or Crassulas are am greenhouse plants that used to be po but are grown by comparatively few to-day. Their culture is so simple a well adapted are they for small greenh from which frost is excluded and ke moderately warm, that they are wo trial. The worth of almost any flov plant in these days is governed largely beauty of its blossoms; and Kalosanth brilliant in colour, continue in flower good time, are fragrant, and can eas struck from cuttings.

Young plants, struck the previous au can be obtained through the adve columns, and these may be pott spring in a compost made up of three peat, one part old loam, with a little g charcoal added. Kalosanthes are not growing subjects, but are not difficult t with once their requirements are under During winter and early spring they be kept on a shelf near the glass greenhouse, and will need very little rather keeping them on the dry side the buds begin to show, which are at t of the shoots; the flowers are crim colour, though there is also a white for will be enough if, during winter and a temperature of about 50 deg maintained, rising to about 65 de summer. They are best grown with a excitement as possible, and a moist, atmosphere is prejudicial to their su

In taking cuttings after they have flo they should be selected from shoots th not bloomed, and only the ripest stripping the two pairs of lower leav inserting them in pots of compost, drained, made up of loam and san mortar rubble added. Rooting hastened by placing them for a few with a propagator, or, failing this, shelf near the glass in a sunny positi will be an advantage if, after taking t tings, they are placed on a shelf and to dry a little before putting them in th post.

W

A good greenhouse shru

Luculia gratissima is a fine subjec wall in a well-heated greenhouse or co tory. It is an evergreen shrub, and trained to a wall or other support, foliage at all times is effective. autumn it bears numerous clusters of f flowers of a bluish-white colour. It at home in a temperature rather ab ordinary greenhouse, but lower th stove, what is known as the inter house.

It is very effective planted out in drained border of suitable soil, and m be grown in a large pot. I find it s best in a compost of three parts light loam, one part peat, a little leaf-sc plenty of sand. The drainage must free, as the plant requires a good su water during the growing and bl period. As the foliage is of an ev nature the roots must at no time be to become dry, though water should given until it is seen the soil is sligh

uch for a careful scientific trial, here
experience of a home gardener :

ct a year ago I first read about this
arming and its effect on vegetation,
Mrs. P. J. Anderson to " The New
d Homestead," and I decided to try
a small scale, of course, because in
mate, where the growing season is
nything that will force the growth of
vegetables is of great value. So in
ing I prepared my garden patch by
g it thoroughly and making it as
possible. I decided to try with corn
cumbers, as they require a longer
than some other vegetables and are
e to frost.

ught one roll of asphalt roofing and
one length of it along one side of
den. I then took a stout knife and
sses through it, about 1½ feet apart,
on the whole length of the strip. I
ack the corners of those cuts so that
l plant four kernels of corn in the
, and then folded the corners over again. That was all I did to my corn until harvest time came. No weeding, no watering, and no hoeing. From my little patch I harvested 126 fully developed ears of the sweetest corn I ever tasted.

I handled the Cucumbers a little differently, I cut the roofing in two lengthwise, making 18-inch strips. Laid down the first strip, planted my seed along the edge in the same way, and so on until my whole garden patch was covered. I left a space of about one-half inch between the strips for the plants to come through, and they began to come in three days. It seemed as if every seed grew. I thinned them out some, but not enough. They grew so fast and vigorously that before long they covered the ground like a blanket, keeping out both sun and wind, so that the first little Cucumbers that formed rotted or dried away. This was remedied by breaking away some of the vines and large leaves.

I had a few Tomato plants set out in the same manner as the corn was planted, but I had them between the corn and the Cucumbers, and the latter choked them almost entirely. However, they yielded a fair crop. If they had been in a more open place they would have been given an abundant crop.

My roll of roofing cost me 2.50 dollars, but just think of the hours of weeding that it saved me! Walked through the garden twice during the summer and picked out a few weeds that had struggled up among the Cucumbers. That was all the attention given them, and neither dry weather nor heavy showers had any effect on them.

I planted my garden June 5th, and began to harvest the last week in August. Corn planted the same day without paper was two weeks later in harvest time. Hay wire staples were used to hold the paper.

Early Tulips and Narcissus

These may now be lifted and laid out on sunny, open spaces to complete their ripening. This will afford an opportunity to dig and prepare the beds in readiness for the summer flowers.

The flower garden

The system of bedding-out plants for summer display in variously formed masses and in diverse associations has almost passed away. It may be decoration in a certain sense, but it is not gardening. The bedding-out system has run for many years and played its part, and been admired more than it deserved. It has favoured the cultivation of plants of most fugitive kind, plants without beauty yet in the mass giving somewhat pleasing results.

Again, with bedding out is the inevitable sameness which is to be seen in any arrangement year after year. Even where there is great skill and taste gained by long experience in arrangement the sameness is still in evidence. But apart from all this there is in these days the tendency towards greater economy in gardens. The country as well as individuals have become poorer, and those who at one time maintained extensive gardens have felt the pinch of these harder times and are compelled to retrench and garden more economically.

A garden of bedding plants is only a garden of luxury without recompense. Away with it. Remake the beds, plant clumps of beautiful shrubs, put in good, hardy, handsome perennials from the host that is now available that need little out-of-the-way care. Do this and we make decorative flower gardening less staid, formal, and costly, but much more pleasing.

The demand for cut flowers is enormously increasing. Then how much better to devote beds and borders to plants that will yield flowers in abundance for cutting? If a great number of cut flowers must be furnished, then devote some portion less prominent, where plants can be grown in abundance and cheaply, and a bushel or so of flowers can be cut without marring the bedding effects. We, most of us, have to keep down the cost of gardening, especially in the floral parts, so if we can cheaply provide a quantity of flowers for cutting there will be far more value for outlay than can be obtained from any system of summer bedding-out. F. H.

Magnolia soulangeana at Kew

A hardy spring-flowering tree of unrivalled dignity and beauty

50 Years' Development of the Early-flowering Chrysanthemum

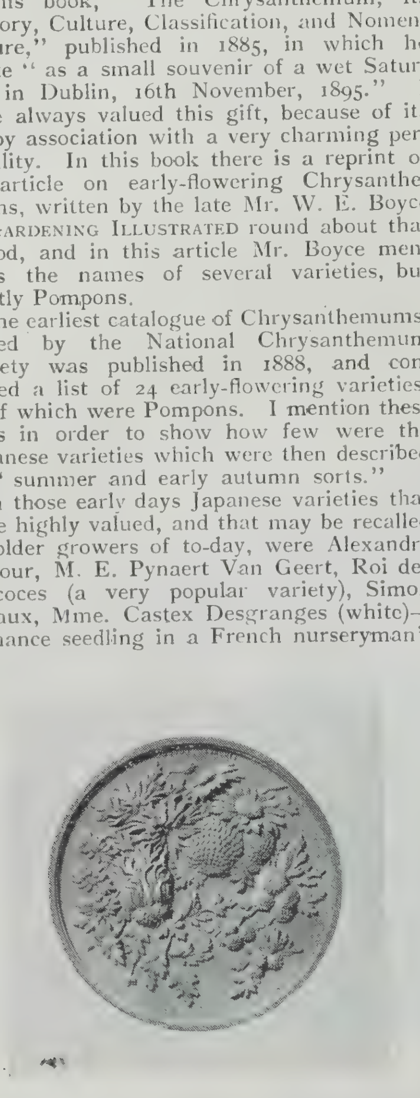
THE record of development of the early-flowering outdoor Chrysanthemums provides interesting reading. In the earliest days of the last half century these plants were often referred to as summer-flowering Chrysanthemums, but the majority of varieties in cultivation at that time were plants of the Pompon type, at that period freely used in parks and public gardens, where their free-flowering propensity and dwarf and compact habit of growth stamped them as ideal for such purposes.

I have before me at the moment a catalogue printed and published in 1886 by the late Mr. H. J. Jones, who at that time carried on the business of seedsman and florist at Hope Nursery, Lewisham, S.E. This catalogue contained the names of 36 early-flowering Chrysanthemums, but of this number quite two-fifths were Pompon varieties, the remainder being of Japanese form and character and a great advance upon the somewhat formal small-flowered Pompons. Some of these Pompons are still grown to-day, notably the varieties Anastasio, Little Bob (syn. Scarlet Gem), and St. Crouts.

In 1895, when I was invited to Dublin to judge the Dalkey Chrysanthemum Show, the late Mr. F. W. Burbidge, the popular Curator of Trinity College Botanical Gardens, Dublin, presented me with a copy of his book, "The Chrysanthemum, its History, Culture, Classification, and Nomenclature," published in 1885, in which he wrote "as a small souvenir of a wet Saturday in Dublin, 16th November, 1895." I have always valued this gift, because of its happy association with a very charming personality. In this book there is a reprint of an article on early-flowering Chrysanthemums, written by the late Mr. W. E. Boyce in GARDENING ILLUSTRATED round about that period, and in this article Mr. Boyce mentions the names of several varieties, but mostly Pompons.

The earliest catalogue of Chrysanthemums, issued by the National Chrysanthemum Society was published in 1888, and contained a list of 24 early-flowering varieties, 13 of which were Pompons. I mention these facts in order to show how few were the Japanese varieties which were then described as "summer and early autumn sorts."

In those early days Japanese varieties that were highly valued, and that may be recalled by older growers of to-day, were Alexandre Dufour, M. E. Pynaert Van Geert, Roi des Precoces (a very popular variety), Simon Delaux, Mme. Castex Desgranges (white)—a chance seedling in a French nurseryman's garden—and its two yellow sports, G. Wermig and Mrs. Burrell, grand flowers when well grown.



Silver medal awarded to Mr. D. B. Crane in 1889 for early-flowering Chrysanthemums

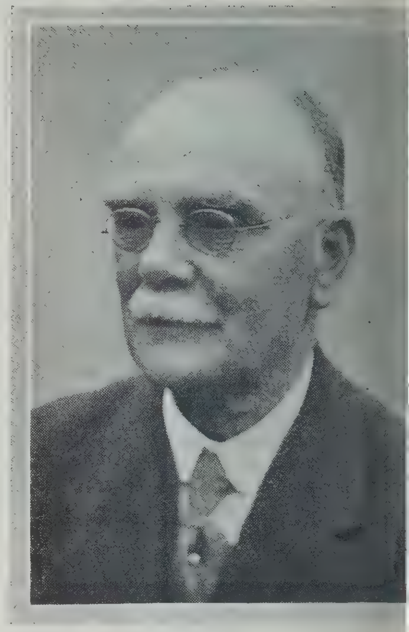
In turning over my medals a few nights since I came across a silver medal which I won in September, 1889, "for 12 bunches early-flowering Chrysanthemums (Pompons allowed), not less than three blooms, with foliage, in each bunch." This was the first exhibition at which a special competition was open to amateurs, and, naturally, I was quite pleased with my success. I recall the difficulty competitors experienced in those days in obtaining the necessary varieties on which they could depend, and remember so well showing the varieties M. E. Pynaert Van Geert, Mme. C. Desgranges and its sports, two or three other Japanese. The rest were Pompons.

We were then on the threshold of great developments. Raisers and growers, represented by such men as Mr. Norman Davis, then of Camberwell, the late Mr. H. J. Jones, who raised that wonderful variety Ryecroft Glory—grown largely for market for years—the late Mr. W. Piercy, of Forest Hill, a most enthusiastic exponent of the early-flowering sorts, and several other men, were all busy exhibiting as and when opportunities were afforded, both at the Royal Aquarium, Westminster, and at the Crystal Palace, in this way illustrating the value of the early sorts for the outdoor garden. At that time, too, market growers became interested, but were largely dependent on the varieties Mme. C. Desgranges and its sports for the few Chrysanthemums that were then grown for commercial purposes.

In 1891 Mons. Simon Delaux, of Toulouse, introduced into England no fewer than 125 new varieties—far too many for any trade specialist or the public to deal with satisfactorily in one year. Mr. H. J. Jones purchased stock of the whole set, and I understand sold complete sets of cuttings to two or three other specialists. I used to visit the collection at Ryecroft Nursery, Lewisham, during the period of flowering, and made notes of the better varieties. For many years subsequently the better varieties were constantly in evidence, but, from time to time, because the names of many of these varieties could not be found in the current issues of the specialists' catalogues, growers, especially florists, would give their own English names to them. Consequently, from time to time, one came across these renamed varieties in different parts of the country, and the correct names of the stocks were subsequently established.

Other Continental introductions followed as the years progressed. It was my good fortune in the early 'nineties to obtain stock of the popular Mme. Marie Massé, and in the following autumn to obtain the first-class certificate of the National Chrysanthemum Society for this ideal plant for the outdoor garden. This variety, in subsequent seasons, produced quite a number of sports, such as Ralph Curtis (white), Rabbie Burns (cerise-pink), Crimson Marie Massé (crimson-bronze), and lastly the much-wanted yellow member of the family, Horace Martin.

This family has been the progenitor of many of the better outdoor sorts raised and introduced since that period. It has been possible to trace the characteristics of the Massé family in numerous English-raised seedlings since introduced.



Mr. D. B. Crane

Continental introductions of importance subsequently distributed were the beautiful novelties raised by Mons. Auguste Nonin, of
Chatillon. This raiser, for several
placed on the market a series of early
showing considerable advance in mar
spects. Some of his better varieties
Perle Rose, Champ d'Or, Le Pactole,
mandie, Perle Chatillonaise, Provence
des Blancs, and Tapis de Neige.
English raisers have each in turn done
to popularise the early-flowering kinds
ably Mr. Goacher, who raised, an
many other good things, Goacher's Cri
Carrie, Lillie, Leslie, Polly, and a h
other excellent varieties, all of which
distributed by the late Mr. W. Wells

There have, of course, been other
whose names it is not possible to ment
this somewhat brief note. In more
years, however, Mr. W. Roots, of Cra
Middlesex, has probably given the w
larger proportion of ideal early varietie
any other raiser. Scarcely a season
without some beautiful varieties bei
rived from this raiser's garden. Th
not always available for the public,
many of them are grown exclusively
well-known firm of market growers
as a rule, after a few years they ar
with in specialists' catalogues under
names. We are much indebted t
raiser's splendid efforts, and our garde
richer in consequence. His Cranford
Cranford Yellow, Hollicot Yellow, Ca
and The Ashes are just a few of the
beautiful early varieties this raiser has
us. There is little doubt as the
progress, we shall enjoy the many
beautiful novelties raised by this
grower. Others hard at work in th
deavour to improve these flowers ar
A. W. Thorpe, of Lichfield, who,
the last few years, has introduced ma
cellent novelties, notably Pink Dam
Crimson Circle, and Mr. H. Woolman
ley, near Birmingham; not a season
without quite a good list of novelties e
ing from this source. Then there is
Shoesmith, jun., Mayford, near W
who has been very successful of late
ceiving first-class certificates for his
ing novelties.

gate, N. D. B. CRANE.

nts for the miniature rock garden

miniature rock garden for the cold use or indoors, varying in size from a p pot a foot across, holding half a lants, to more elaborate structures of stone, or cement, and containing up ozen or more specimens, appeals to an ng number of garden lovers. It may ght indoors when flowers are scarce; nts will most probably bloom a fort- arlier than those on the rockery, and, judicial selection of plants, one may mething in bloom almost the whole trough.

rtunately, many rock plants are un- either to close conditions over a pro- period, or to indoor treatment. But some months in the summer to and re-potting, or a fresh batch of each year when the others are planted re are many plants that will do well an environment.

egin with the carpeters, a general e is the tiny Mentha requieni, with its Lavender flowers and fragrant foliage. mes a severe or very wet winter will it outdoors, but in the miniature rock it gives no trouble.

are several Arenarias available. A a is possibly the best, though its A. cæspitosa, a dark, rich green tiny grass, A. cæspitosa aurea, its variety, and A. gracilis, are all ble as close carpeters, with white sparsely borne. In time they will erything with a green or yellow mat, are the easiest subjects to pull apart they be likely to swamp other plants. two Raoulias, australis and glabra, decided contrast with their silvery Both do well in the miniature garden, and although there is little to choose between them, being very alike, R. glabra makes the quicker growth. These are, perhaps, the best of the true carpeters, for one can scarcely call Sedums, Drabas, Armerias, and such-like carpeters in so small a space as the indoor garden.

The next thing to head for is a trailing plant that will hang over the stone, over the sides of the pot, and give as much variety as possible. To mention several for this purpose, perhaps the choicest is the lovely little prostrate Hypericum cuneatum, flowering in summer. It is rather tender to handle, the joints easily breaking, but the golden yellow blossoms, opening from red buds, and the pretty boat-shaped leaves and red stems, spreading prostrate over the stones, are well worth treating the plant carefully.

Then there are Saxifraga oppositifolia splendens and Linaria æquitriloba. The former, one of the earliest and most beautiful of the Saxifrages, makes a splendid show of brilliant rose-coloured blooms in February, and delights to swing them over the pot side. With the latter, however, one has to deal with rather a rampant trailer. On occasions its enthusiasm must be checked, and some people regard it with disfavour for this reason, but it is a useful plant, blooming continuously throughout the summer and autumn, and its dark green, rounded foliage and mauve flowers—rather paler indoors than out—add considerably to the garden.

The lovely yellow Rose Mrs. E. J. Beaty which was so admirably shown at the Spring Rose Show (page 293)

Two small gems worthy of note are Mimulus radicans and Aquilegia discolor. M. radicans is a delightful plant that creeps haphazardly round the pot with its curious leaves dark-blotched towards the inner end, and its purple, yellow-centred little flowers. June and July is its flowering period, and, like most gems, slugs love it. Aquilegia discolor is a small plant about 4 inches high, and flowers at the same time as the Mimulus above. Unmentioned by Farrer, it probably gets its name from the rosy flush upon its cream inner petals, against the light blue outer ones. Aquilegia pyrenaica is also worthy of a place if one can happen upon a small variety of it, that is, in the vicinity of 6 inches or so.

For January flowering, that gorgeous miniature Iris reticulata supplies something choice when most needed. The bulbs may be planted beneath the carpeters any time from September to November—the earlier the better—and shortly after Christmas the grey-green buds opening into rich purple blossoms, splashed with orange, push themselves through the turf. Apart from its earliness and beauty, the peculiar charm of this Iris is that it is sweet scented.

Of the huge family of Campanulas there are several worthy of a place in any miniature garden, and among them are C. fenestrellata and C. Zoysii. The former has very pale blue, star-shaped flowers, set amidst delicate, fresh green leaves. Blooming in July, it makes an ideal subject. The tiny blue C. Zoysii, with its curiously shaped tubular flowers borne profusely, does well amongst plenty of limestone chips. Unfortunately the plant makes an irresistible appeal to slugs, so that even in the miniature garden the stray slug has to be watched for. Because of this care, C. Zoysii will do better than on the rockery proper.

There can be no doubt that no sort of rock garden can be complete without a shrub, or, better still, a small Conifer, for their greenery is scarcely ever liable to mutilation by pests, and so often their colours are such that they achieve a distinction among flowering plants. Above all, their manner of growth—either erect and stately or gracefully prostrate—produces a quiet but very effective dignity it is hard to obtain with other plants. There are many of the smaller Cupressus and Retinospora worthy of a place in the large indoor gardens and but few in the smaller. But in Edraianthus serpyllifolia, Veronica Hectori, and Juniperus communis compressa all that can be desired is found. The first is a silvery, woolly shrub, the second a fine, upstanding little shrub like a tiny Monkey Puzzle, and the third a very erect plant with pale grey-green leafage that is ideal for breaking the monotony of flat, creeping foliage. Outdoors the Edraianthus needs a pane of glass against our wet winters, but the indoor garden seems to suit it well.

W. S. M.

Linaria alpina

Certainly one of the most charming of Alpine plants, this delightful little gem is not at all difficult to establish in sandy, gritty, and rather moist soil, or in crevices in the sunny spots of the rock garden. The Alpine Toadflax is short-lived, but when happily placed it seeds itself so very freely as soon to form cascades of silvered leaves and brilliantly coloured blossoms. The small bluish-violet flowers are vividly touched with orange, and rosea variety is a charming confection in silver, pink, and orange. These Linarias are easily increased from seeds, which should be sown in spring in a cold frame, or in the places in the rock garden where the plants are to flower.

Another treasure is Erysimum, or Cheiranthus linifolium, almost ever in flower, trusses, cascades, and torrents of softest mauve and lavender colouring—an ideal plant for clothing the top of an old wall, or a very dry, sunny slope or bank. The plants delight in a stony soil, and will readily cover a considerable area with innumerable self-sown seedlings.

RALPH E. ARNOLD.

REMINDERS FOR THE WEEK

Southern and Midland

Vineries

Attend regularly to the tying down and stopping of growth, and endeavour to arrange for an even distribution of the foliage over all parts of the houses. Black Grapes colour better beneath a denser canopy of leaves than white kinds, and this should be borne in mind during the stopping period. In ventilating, avoid cold draughts at all cost, for although a generous opening of the ventilators may be desirable on warm, mild days, this state of things cannot be permitted when cold, easterly winds are prevalent, however bright the sun may shine. Colouring is apparent in the earliest house and a little air may be admitted night and day, but this must not be accompanied by falls of temperature. Careful observation will also be required to see that the condition of the borders is correct at this critical period, but if the latter are properly drained there need arise no fear of stagnant conditions.

Peaches and Nectarines

The earliest fruits will shortly commence colouring and should be exposed to sunlight as much as possible by keeping the growths pinched or tied back, and even removing a leaf or two, if necessary, to admit light. Generous feeding of trees growing in pots and confined spaces may be indulged in until two-thirds of their ultimate size has been reached, when feeding, even of a diluted nature, must cease. Air may now be more freely admitted on all favourable occasions, and those trees which have just completed their stoning should not only be vigorously syringed, but kept abundantly supplied with water. A night temperature of 60 degs. to 65 degs. Fahr. should be maintained.

Figs

Vigorous syringing must be indulged in to keep these free from Red Spider, and overcrowding of the foliage must be avoided at all costs. Those carrying heavy crops, whether in pots or borders, must be liberally supplied with diluted manure water, and even given a light mulch.

Malmaison Carnations

A light shading for use during the brightest hours of the day should be erected over those now coming into bloom, otherwise loss of colour will result and the flowers be lacking in freshness. Thin out the buds, leaving one only on each stem, and tie the shoots in neatly to slender stakes. Stimulants may be applied twice weekly and air admitted freely from both top and bottom ventilators. A few well-flowered specimens arranged in flowering houses and conservatories will be much appreciated, and find the conditions therein to their liking.

Hippeastrums

Plants raised from seed during the present season should be kept growing freely. As cleanliness is of the greatest importance at this stage, the syringe must be applied vigorously among them, and an occasional fumigating given to keep at bay Thrips and Red Spider, their greatest enemies. Keep the plants potted on as required and place close up to the glass in order that growth may be vigorous and clean.

Water Lilies (Nymphæa)

This is an excellent time for establishing plantations of these beautiful subjects, which will thrive in almost any good loamy soil, or even in the muddy soil of lakes and pools. The water is getting warmer each day and plants put in now make headway at once. While these fine plants will thrive with 8 inches of water over their crowns, the ideal appears to be 18 inches. I have, however, grown them successfully in 8 inches of water and 4 feet, and on one occasion a group was very beautiful for several years in 9 feet of water, therefore no one need hesitate to try a few plants who can provide a foot of soil to grow them in. Other water and waterside plants may also be planted at the present time with success.

Runner Beans

These may now be sown in the open, either in prepared trenches or on well-manured land. The drills should be drawn 4 inches deep and 6 inches to 8 inches wide, and the seeds placed in double rows at 8 inches apart. Excellent varieties are Sutton's A 1 and Hackwood Park.

Spring Cabbage

A little sulphate of ammonia sown thinly among the plants will be found very beneficial and will push forward those which received such a check by the severe winter frost.

Pears and Peaches in the open

Stop the shoots of the former at about five buds from their base while it is still possible to do so between the thumb and finger. Attend to the training of the latter when 8 inches in length, pinching back superfluous shoots.

E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Tuberous-rooted Begonias

Get these attractive subjects transferred to their flowering pots before they get starved, in boxes or small pots, as the case may be. A good substantial compost should be provided. Three parts very fibrous loam, two parts not too old leaf mould; a good dash of wood ashes, and just enough coarse sand to ensure porosity. If too much sand be included, the plants are almost certain to be attacked by that little pest, the Begonia mite. I find that the above compost gives good results, but the addition of a 6-inch potful of bone meal and a 5-inch potful of Thomson's Plant Manure to each barrow-load of soil is a decided improvement.

Repot young Pelargoniums

Young plants of these useful subjects, be they of the Regal, scented leaved, or Zonal type, if growing in 3-inch or 4-inch pots, should now be fit for transference to their flowering pots; those 6 inches in diameter being, as a rule, the best size to use. The compost advised above for Begonias will suit, but rather less leaf mould should be used.

Primula Obconica

This grand winter flowering plant should always be carefully treated. It dislikes dryness at the roots very much, but is even more easily ruined by over-watering, especially in the case of plants that have not well filled their pots with roots. The earliest batch should now be ready to be placed in 3-inch pots, while the later sowings must be pricked off into boxes of good soil while still quite small. Shade carefully and do not give too high a temperature—55 degs. being a very suitable warmth at this stage.

Harden off Dahlias

If of decent size and well rooted, the cold
frame is the best place for these plants
now until planted out early in June. D
neglect giving sufficient water, and whi
sashes should be drawn right back durir
day, they should be run on at night unle
weather is very mild. The sturdier the
are, the better will be the blooms.

The planting of Pentstemons

These grand autumn flowering plant
now, with perfect safety, be planted in
flowering quarters. Fairly rich and
worked ground is desirable, and a sunr
sheltered position will give best results.
large flowered varieties are very hand
and stately, while the Newbury Gem
gives a great mass of bloom when mas
beds or borders.

East Lothian Stocks

Should the weather be at all genia
to get these fine Stocks planted out, a

Growing window plants for exhibition

MOST horticultural societies encourage the growing of plants suitable for window decoration by offering prizes for the finest specimens, but there is often ambiguity shown in the framing of the schedules, with the result that disappointment and heartburning sometimes follow. For instance, I have known a schedule to read "window plants for show," "plants suitable for a window," without any qualification as to whether the plants may be grown in a greenhouse, or whether they must have occupied a window, and, if so, for how long? It seems to me, as an old exhibitor, that those responsible for compiling schedules cannot be too explicit as to what is actually intended. More than once I have heard acrimonious discussions after awards have been made, as to what actually has been meant. The man, for instance, who grows, say, Fuchsias, Geraniums, Vallotas in his house window from young plants, and who has no greenhouse, should scarcely be expected to compete with one who can bring on what he proposes to exhibit under the roof of a greenhouse, yet, in view of the wording of the schedule, "three plants suitable for a window," he appears to be right in doing so. There should be a class for the encouragement of window plants grown, as such, to give those who have no glass a chance, whatever is offered in the case of plants grown in a greenhouse. Those who contemplate exhibiting window plants should, if the schedule is not clear, have an understanding with those responsible for drawing it up, before the show, as it often saves unpleasantness afterwards. I write from experience in this matter.

LEAHURST.

Raising new varieties

The raising of new varieties of florist's flowers is an interesting and profitable hobby. Suitable subjects to take in hand are Delphiniums, Border Carnations, and Pyrethrums. From a batch of plants, you will usually get one or two good varieties, although it is seldom you get a Millicent Blackmore, a Duchess of Fife, or a James Kelway. No doubt it is cheaper to leave this work to the specialist, but it adds great interest to the work of the amateur and professional gardener alike to watch the development of a batch of seedlings, and, happily, the interest does not end here, for when the plants are in full bloom you have got to make up your mind which are worth retaining and propagating; always remembering that in our gardens of to-day there is only room for something above the average. Even after they have been propagated for a year or two they may show signs of deterioration and have to be discarded. To show how difficult it is to get something outstanding, I remember some years ago reading a lecture by a well-known grower on the raising of new Carnations. He said that their firm, on an average, grew about 2,000 to get one sufficiently superior to supersede any of its class already in commerce.

I don't mean to infer, however, that because a new seedling is not capable of ousting some well-known variety from its position that it is not worth growing, far from it. Nothing adds more interest or distinctiveness to your herbaceous border than several clumps of Delphiniums, Lupins, Gaillardias, Pentstemons, etc., that have been raised in your own garden, and that are different from the varieties your neighbours are growing.

TEVIOTSIDE.

From Gardening Illustrated

Fifty Years Ago

Napoleon

THE Peach tree shown in our illustration represents one of the many ways of training fruit trees on walls adopted in some French gardens. It cannot be recommended as by any means the most profitable method of growing fruit trees, but it affords amusement to those who have plenty of time to attend to it, and who prefer pleasure to profit. This method of training is performed by cutting back to buds where branches are required, and spurring in superfluous growths. Such trees show to the best advantage when trained on white or stone-coloured walls.

Hardy Carnations

Those raised from seed in March are ready for planting out, and beds which have previously received a dressing of lime should be prepared for them. It is important that such beds should be well drained, and where possible raised above the ordinary level.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

FLOWER GARDEN

Sweet Pea seedlings

(Robert Parry).—The small plants sent are so dried up that we can make nothing of them. You should have packed them in damp Moss and so given us a chance to discover what is wrong. Planting Sweet Peas on the same ground over a number of years usually leads to the plants going off in the manner complained of, while too strong doses of manure would have a bad effect. However, if you care to send us on another plant or two properly packed we will be glad to try and decide what has caused your plants to go off.

Sweet Peas

(Inquirer).—It is usual to pinch out the point of Sweet Pea plants when it is intended to grow them on the single stem system. It is immaterial which of the new growths is retained, selecting, of course, the strongest and most promising one.

A dwarf carpeting plant

I have in a corner of my rock garden an irregular patch about 8 feet by 4 feet in which I have choice spring bulbs—Anemones, Fritillarias, Crocuses, and all the miniature Daffodils. These are all right just now, but look either bare or untidy for the rest of the year. Can you suggest a satisfactory carpet that they could live under and grow through, not above about 3 inches high, which would keep itself in order without constant attention and trimming, and not be liable to go off in patches? A small Thyme, or Hypericum, or possibly even Arenaria suggest themselves, but I am not sure that any would be quite suitable. E. FAWSSETT.

[Either of the following would be found admirable for the purpose of carpeting your early spring bulbous flowers and would bloom at a later season:—Gypsophila fratensis, G. repens, Geranium pylzowianum, Helichrysum bellidioides, Thymus micans, T. Serpyllum var. coccineus, Sedum murale, S. spathulifolium, and S. obtusatum. Saxifraga apiculata is also very suitable for this purpose, remaining green all through the summer, but flowers during April. Some of the Mossy Saxifrages are also used successfully for this purpose.]

Tulips producing several buds on one stem

Can you explain this curious phenomena? In a large bed of healthy-looking Tulips a very large percentage are producing three, four, and often five buds in a cluster. In these cases the stalk is considerably thicker than the usual Tulip stalk, in others there are buds appearing up the sides of the stalks as well as the one healthy-looking one on top. We started disbudding so as to help the blooms, but left a few to see to what extent they would open. E. P.

Silchester.

[It is difficult to say with any degree of certainty what has caused your Tulips to behave in this manner, but it looks as though the bulbs must have been damaged in some way when developing their growth last year. Of course, you are aware that a few Tulip species produce several flowers on one stem, but we gather from your letter that yours are just ordinary varieties. We should be inclined to get rid of them after blooming and plant others on a different border where Tulips had not previously been grown. The cause of the trouble was in the bulbs at planting time.]

Meconopsis Baileyi

In reference to the correspondence in your paper concerning the new Poppy, Meconopsis Baileyi, I have a good number of seedlings now ready to plant out, and should be grateful if you would kindly advise me as to the position and soil in which they would be likely to do best. Do they prefer shade or partial shade? Do they mind some lime in the soil? Would they live under trees, a damp position or otherwise? H. C. GAYE.

Seaton, Devon.

[This beautiful and easily grown Poppy loves partial shade, such as that afforded by summer-leafing trees, but it needs light also. Therefore endeavour to choose a spot approximating to that of a woodland clearing where a large tree relieved of its lower branches has been left at intervals. The soil should be a mixture of loam, leaf-mould, and sand, and fairly moist, especially during the growing season, but at no time must it become stagnant. Given this the plants will luxuriate and become almost as large as Cabbages, carrying, in addition to the large central spike of bloom, many large side growths bearing their quota of handsome flowers. Of course, this Poppy can be successfully grown in cool borders containing a proportion of lime in the soil, but the latter is certainly not essential, and from observation the plant is happiest where lime does not exist. Shelter from wind is desirable, and this is one of the reasons why it does so well in woodland clearings. Like the majority of its genus, position counts for a great deal, and if this is carefully chosen success is certain. Your plants, if put out now, should flower in May, 1930.]

Diseased Narcissi

The Narcissi in my garden which I planted three years ago all appear to be affected with bulb rot, as they refused to bloom this year and were rotten when I lifted them.

I see by your reply to Mrs. H. Royston in a recent issue that treatment of the soil with formalin solution is expensive, and that it is best to choose a new site for the healthy bulbs, but as the Daffodils were planted all down one side of the garden, I should be glad to know whether I could use this space for other bulbs, particularly Crocus and Tulips; or whether these would be liable to the same disease?

I might add that when lifting the Narcissus bulbs I put a handful of lime in the holes left before filling up. Will this be of any use? N. LESLIE CAVE.

[Your query is not easy to answer because there are several diseases which cause Bulb
Rot, some of which only attack Daffodil
the others are more general and w
occasions attack other bulbs. If it is n
late for you to send us a specimen we
determine the actual cause of the Bull
and be in a better position to advise.
ing this, we think it would be advisal
you to treat the soil with a goo
sterilizer before planting any other k
bulbs. The lime you applied will do

r leaves for examination

, Norfolk).—The leaves have been
ither through an excessive dose of
or insufficient ventilation, it is dif-
y which. Cucumbers should not be
o flag during hours of sunshine,
the trouble you complain of is sure
to follow. The leaves are also badly attacked with Red Spider, and the worst of them should be removed and placed on the fire. To grow Cucumbers successfully, a heated house or frame is desirable where a temperature of 65 degs. to 70 degs. is maintained at night, rising by sun heat during the day to 100 degs., or even more, after closing down the house in the afternoon. Good, rich soil, possessing a liberal addition of decayed manure is advisable, and this, coupled with a brisk, moisture-laden atmosphere (the plants being syringed twice daily) and care with airing, will produce Cucumbers of the highest quality in abundance. Vigorous syringing is the best means of keeping Red Spider at bay. You cannot expect to grow good Cucumbers in an ordinary greenhouse of mixed plants.

GREENHOUSE

Scorched Petunia

(Henpecked, Devon).—We have examined your specimens and can find no trace of a fungus likely to cause the spotting of the foliage, and conclude that the damage must be due to some cultural error. From the appearance of the plant it looks to us that you may have been a little too generous with your feeding, with the result that the foliage is rather on the soft side. Water has collected on the foliage, and some time or other the sun has caught it and has burnt it. You could harden up your foliage by using Sulphate of Potash, at the rate of 1 oz. to 2 galls. of water. If this was given, say, about three times at fortnightly intervals it should be sufficient.

TREES AND SHRUBS

Climbing plants for wire netting

I wish to grow climbers on wire netting 12 ft. high and 100 ft. long on one side of a tennis lawn, but have never grown any on wire netting. Would you advise a number that would form a screen and look well throughout the year without encroaching on the tennis lawn too much? Would any of these named be suitable? Aristolochia Sipho, Jasminum officinale, Clematis Flammula, C. orientalis, Lonicera Pericyclymenum, L. Belgica, L. Serotina, L. Halleana (japonica), Lathyrus latifolius, L. Grandiflorus, Tropæolum speciosum, Hydrangea petiolaris, Vitis cordifolia, Ampelopsis Veitchii, Lonicera nitida, Stauntonia latifolia, Solanum Jasminioides, Clematis Montana, Wistaria sinensis, W. multijuga, Polygonum baldschuanicum, Climbing Roses, Secoma, Bignonias, or Ivy. Can you suggest any that would be most suitable, bearing in mind that they should require the minimum amount of training?

Barnstaple. S. I. Knill.

[Most of the subjects would be suitable, but would require pruning each year, otherwise their weight after reaching the top would become so great that it is doubtful whether the wire could support them, especially during stormy weather and when in full leaf. The finest Ivy for the purpose is the handsome Persian Hedera colchica, with leaves often 8 inches to 10 inches across; and the most handsome Honeysuckle is Lonicera tragophylla. Pyracantha Gibbsii is good and provides a feast of scarlet fruit in autumn. Other handsome subjects are as follows: Clematis Jackmanni superba, C. lanuginosa, C. Lasurstern, C. Chrysocoma, Vitis heterophylla, Actinidia arguta, Pyrus japonica var. splendens, Escallonia langleyensis, E. Donard Seedling, Ceanothus Gloire d'Versailles, Roses Paul's Scarlet Climber, Paul's Lemon Pillar, R. Cupid, Jasminum primulinum, Ruscus androgynus, Vitis Henryana, and possibly V. Coignettiæ.

Of the Bignonias, both radicans and grandiflora should succeed in your county.

E. M.

MISCELLANEOUS

Cut flowers for market

(C. V. N.).—As a general proposition there is money in flower growing for market if run on right lines. The right things must be grown and must also be of first-class quality, resultant on high cultivation. Also, they must reach market picked according to market methods, and arrive fresh and undamaged. Your distance from reliable markets is a great drawback, say, to Belfast, Londonderry, Dublin, Liverpool, Manchester, and Bristol; the carriage even to these markets would be almost prohibitive. We would advise you to get into touch with reliable men in these markets and discuss with them what they can best handle to advantage. Also read " Cut Flowers for Market," obtainable at this office for 2s. 6d., or through booksellers. The kinds of flowers you select should be of varieties that will travel well, such as: Single and double Pyrethrums, Irises (half open), Daffodils (half open), St. Brigid Anemones, Statice latifolia, Double Gypsophila, Chrysanthemums, Tulips (half open), Scabiosa. Our opinion is that if you can overcome the distance difficulty and grow really good stuff, you have a very good chance because your land would not be highly assessed, and also labour cheap. Salesmen: Belfast, Tooney Bros., Ltd.; Dublin, James Duffy; Liverpool, Daniels and Son, J. T. Poupart, Ltd.; Manchester, F. W. Johnson, Ltd. (flowers only), Austin Coe; Cardiff, W. Bradnum and Co.; Glasgow, Muirhead and Maxwells.

Cheiranthus Newark Park wanted

(R. Pearce).—We are sorry to say that we have been unable to find anyone offering this plant at the present time, and doubt if it can be obtained unless from some private source.

Cleaning rough ground

(A. T. W.).—There is nothing better than growing a crop of Potatoes for bringing rough land into cultivation. Now that the soil is broken up in the rough state you may plant the Potatoes in rows a yard apart. The constant hoeing and earthing-up does much towards bringing the land into a clean and fertile condition.

SHORT REPLIES

G. T. W.—*Re* stimulant for Box trees root-bound in tubs. Occasional liquid-manure, soot-water, or Clay's fertiliser would have the desired effect from now onwards till the autumn. The trees should be put into fresh tubs next March.

B. H.—Spray the Apple trees for Winter Moth grubs with lead arsenate immediately after the petals have fallen. See note " Spraying fruit trees in open blossom," issue April 27th, p. 292.

NAMES OF PLANTS

H. W.—Primula nivalis, common in the gardens of Scotland.

G., Dublin.—1, Potentilla Dubia; 2, Helianthemum, possibly Miss Mold; 3, Holcus lanatus; 4, Salvia officinalis var. purpurea (common Sage); 6, Aucuba japonica maculata (female) (see article this week on Laurels, page 312); 7, Ilex aquifolium var. laurifolia; 8, Sedum elongatum; 9, Forsythia suspensa; 10, Ribes aureum; 11, Eleagnus edulis. Aucuba japonica produces its fruits only when both sexes are growing in close proximity, one male plant being sufficient for the successful fertilisation of 10 or a dozen of the other sex. In purchasing this shrub it is advisable to see that you secure both sexes.

M. K., Stow-on-the-Wold.—1, Epimedium pinnatum elegans; 2, Anemone Ranunculoides.

VEGETABLES

The cultivation of the French Bean

THE seeds of this vegetable may be sown at the present time. If the crop is to prove satisfactory it must be provided with a rich and well-worked soil. I incorporate farmyard manure at the rate of 10 cwt. per 75 square yards of land, and, wherever possible, the ground is double dug. Many germination failures associated with the French Bean may be attributed to deep sowing. Being of tropical origin, the seeds of the species should be deposited in the warm surface soil, as they are liable to decay. I have proved, by experiment, that germination is most successful when the seed is buried at a depth of 2 inches. A double row of seeds should be placed in each drill and each seed should be accorded an all-round distance of 6 inches, to permit proper development. As a safeguard against defective germination or the appearance of weak seedlings, it is well to scatter a few extra seeds at the end of the drill. I have found it a decided help to root formation to sprinkle superphosphate in the drill when sowing, at the rate of half an ounce per lineal yard. The only cultural attention necessary, until Beans are set, is a periodical stirring with the Dutch hoe, to promote good soil, texture, and destroy weeds. Artificial feeding may commence at the time indicated, and for this purpose dilute liquid manure is recommended. The applications may be made at weekly intervals as long as there are any Beans to feed. It is desirable to point out that Red Spider is an inveterate enemy of the French Bean, and any attack must be defeated in infancy or the crop will be ruined. I have known vigorous syringings with chilled water effect a clearance, but if this measure proves useless recourse may be had to a solution made of the following formula: Soft soap, ½ lb., water, 2 gallons. Obviously, it is dangerous to use poisonous specifics in the kitchen garden. Of the many varieties of the French Bean in cultivation, I consider that masterpiece Ne Plus Ultra and Longsword are the most suitable.

GEO. H. COPLEY.

Protecting Asparagus

Just when the first shoots are peeping through the surface we not unfrequently experience a rather sharp frost, their loss being the consequence. Those with their crowns very near to the surface are especially liable to be caught in this way, and these ought, in any case, to have a mulching of very light compost, or failing this, either leaf soil, spent tan, fine peat, or old Mushroom-bed manure, a general mixture answering well. This extra covering, in addition to preserving the young shoots from frost, will also be the means of improving the length of blanched stem and its value accordingly. The least that can be done is to well mould over those clumps grown at a good distance apart, while the beds generally may with advantage receive a loose covering of strawy litter.

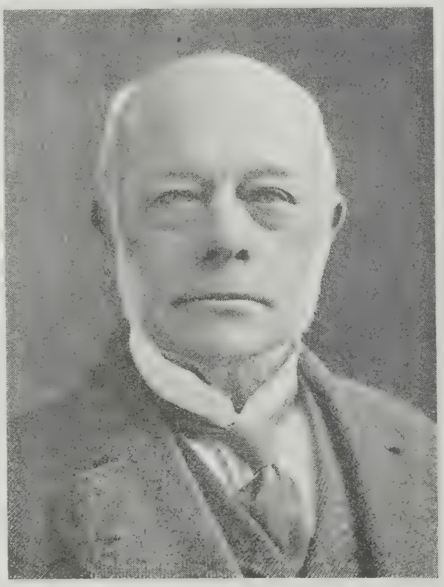
Royal Gardeners' Orphan Fund

The annual festival dinner will be held at the Savoy Hotel, Strand, London, W.C. 2, on May 15th, under the Presidency of Mr. Samuel Wallrock. We are grateful to those readers who from time to time send contributions to us on behalf of this deserving fund.

OBITUARY

W. J. JEFFERIES

IT is with deep regret that we record the death of Mr. William John Jefferies, nurseryman, of Cirencester, in his 85th year. For many years he had been the moving spirit in the long-established firm, John Jefferies and Son, Ltd. He was a man of rare business instincts, unusual activity, unwearied industry, and sound knowledge of nursery management. He was recognised by colleagues and competitors as an authority whose opinion and advice were always worth seeking. Under his enterprising and fully-informed direction the firm's nurseries were steadily increased in area till they included those at Tower Street, Watermoor, Siddington, London Road, and Somerford Keynes. To all these he gave his daily supervision, in earlier years on horseback, later by driving, and last of all in his car. He was a familiar figure at the meetings of the Royal Horticultural Society, and served on the Fruit and Vegetables Committee as well as other committees of the Society. He was a Past President of the Horticultural Trades Association, and his services were often in request in London and the provinces as a judge of horticultural exhibits.



The late W. J. Jefferies

Past President of the Horticultural Trades Association

He devoted himself largely to the production of forest and ornamental trees, gaining for his firm a high reputation for the Conifers grown in their nurseries. Roses were another of his specialities, and from his early days he was an enthusiastic and successful grower and exhibitor, being a member of the Council of the National Rose Society for many years. Nor did the more prosaic departments of the business, such as farm and garden seeds, lack his close personal attention, and on his weekly visits to the Cirencester Corn Market, which continued up to a few months ago, his farming friends and clients always welcomed his genial presence and wise counsel.

Shows

The City of Salford are holding their thirty-eighth show this year at Buile Hill Park on September 3rd, 4th, and 5th. The schedule which has just been issued is a very comprehensive one, and covers nearly 300 classes in the horticultural division. The prizes include several valuable challenge trophies offered in some of the popul
attractive divisions. One section of th
is devoted to the Manchester and
Pansy and Viola Society. Copies
schedule can be obtained from the Se
Mr. J. Richardson, Parks Supt., Bui
Park, Salford, Manchester.

Messrs. Stuart H. Low and Co., Middlesex, staged in addition to awards, Cymbidium Alexanderii Roseum and Odta. Sanderæ.

Mrs. Hollas, Grimsaigh (gardener, Mr. Selby), staged Lycaste Skinnerii.

Mr. D. M'Leod, Chorlton-cum-Hardy, staged Odontos. in variety.

The next meetings will be held at the Houldsworth Hall, 90, Deansgate, Manchester, on Fridays, May 3rd and 17th, 1929.

The Committee will sit at 12 o'clock noon as usual. H. ARTHUR, Secretary.

44, *Mere Road, Blackpool.*

Flowers at the Academy

PORTRAITS and flower paintings dominate this year at the Academy. With the portraits we are not so much concerned, but the flower paintings call for a few observations. Many of the flowers depicted are of poor and inferior varieties. It must be just as easy to paint good and well-grown flowers as poor, anæmic, and weak-stemmed specimens. Well-grown Irises with Venetian glass would look far happier than flowers that had evidently been in a florist's window for days. Then, again, why will artists paint Lilies that have had their anthers removed? Is it necessary to emasculate the Lily in order that it may be an emblem of purity. There are many pictures at the Academy this year in which Lilies appear minus their golden anthers. This is worse than sacrilege. The Royal Lily (Lilium regale) figures in many pictures this year.

The flowering exotic by Adrian P. Allinson is some form of Tillandsia, and Paul Methuen's "Tropical Orchid" may be an Angræcum, but it is indistinct.

A fair number of still-life pictures, as studies of fruit and flowers, are to be seen. The fruit mostly chosen are Apples, Grapes, Plums, Pineapples, and Pumpkins. There are about 30 different flowers selected as studies, Roses crowning the list, with Chrysanthemums coming second. Mixed bowls and bunches of flowers are large in number, and there are fruit trees out in blossom, as well as garden scenes. One of the finest landscape pictures is that by Harry Bush, "The Old Pear Tree in Spring," which shows a Pear tree in a lawn at the back of a row of suburban houses. The blossom is not yet out, but the sunshine is warming everything into life.

One of the best landscapes is that by Sir David Murray, R.A., "Beneath the Bridge the Sleepy River Flows," showing an ancient old stone bridge, beautiful trees and grasses in early greenery, and wild flowers. Another delightful country scene is that by Stanhope A. Forbes, R.A., in his "Across Relubbus Stream." A strongly built stone bridge with boys sitting on the coping and a man leading a horse and cart over the bridge. Foliage is growing between the stones of the bridge. A rather nice study of still-life is given by Edward Chappel, depicting Apples, Grapes, and Pineapples, while a dark blue curtain as a background makes delightful contrasting colours.

"Cheyne Walk Gardens," by Fairlie Harmar, is a typical London park scene. Children are seen playing in the path with their nurses sitting on the seat chatting. Trees just budding, with tall Irises not yet in bloom form a bright green border along the edge of the grass. Houses and traffic are seen in the background.

Two very delightful garden scenes with herbaceous borders are depicted by Sir David Murray, R.A., in "'Neath Summer Skies," as also "The Garden at 'The Swan.'" And again Joseph Farquharson, R.A., exhibits one of his attractive pictures, "In My Garden," the flower border being ablaze with colours of various hues. A portion of "Queen Adelaide's Garden, Windsor Castle," is given by Lilian Stannard Rambler Roses are seen on the right, with trees in the background and a beautiful green lawn towards the left.

A beautiful study of "Flowers and Fruit" is shown by Leonard D. Philpot. Long-petalled Chrysanthemums with Asters, Pæonies, and Phlox, Pineapple, Plums, and Pear, all blended exquisitely. "A Provencal Forecourt," by H. H. La Thangue, R.A., is a typical Continental scene. In the forecourt a girl is standing by a low wall on which are two large Pumpkins. She is holding another which she is cutting up. In the background are some small cottages and a boy with a donkey. The donkey carries two baskets, one each side of his head. The vivid orange colour of the Pumpkins contrast well with the stone colour of the rest of the picture and is very effective.

A homely picture is that by Frederick W. Elwell of "An Inn Kitchen." An old woman is shelling Peas at a table, with three maids looking on. The cook is cooking fowls. The other furniture and utensils is typical of an inn kitchen.

"The Breakfast Table," too, has not been forgotten, for in the painting by J. Wace, Daffodils, Oranges, and Bananas are seen on the table. Birthday greetings may well be said with flowers is depicted in the dainty picture by Anna Airy, "Spring Birthday." A lady dressed in blue, with voluminous train, is holding a bunch of Violets. Before her is a bowl of Azaleas, and some Lilies are seen on a table in the background.

A delightful combination of mauve-coloured Scabious and pink Roses is depicted by Edwin Byatt, and his "July Fragrance," of pink and red Carnations in a greyish-looking bowl, with pink and mauve tinted Sweet Peas by the side, is very attractive. "The Royal Lily," by William M. Milner, is very nice, and "The Flowering Exotic," by Adrian P. Allinson, is a very good piece of work.

A very good study of Daffodils is that by Thomas T. Blaycock, a bunch of Daffodils with Narcissi in a blue vase. Fanny G. Wheeler makes a delightful study of Delphiniums in a glass, and Graham Petrie in Hollyhocks in a cottage garden depicts a pretty countryside picture. In looking at "Mary and Martha," by Midge Bruford, it is difficult to tell whether Mary tempted Martha or *vice versâ*; they are both eating Apples, and seem to be enjoying them, for there are plenty of Apples on a table. A very pleasant study of "Still Life," by Linda Travers, is shown with Apples and Plums in a dish, with Plum on the table. A charming study of "Flowers and Figures" is that by Madge C. Fawkes, depicting mixed flowers in a vase. The dark background throws up the colours and m
very attractive.

We must not forget to mention
Lee, Hawker," by Isabel Codringto
ruddy cheeks, large ear-rings, simpl
hat with straight feather round it,
thrown round her shoulders, just sh
checked blouse underneath and
skirt, nursing a basket as she rests on
trunk, is a very good study.

Summer treatment of Solan

There is something very attracti
well grown pot of Solanum capsicastr
popular winter Cherry, when full of
of green and orange red, and it is
surprising that amateurs who own
houses do not grow them more Th
ture is not at all difficult; as they
little room and come to beauty in
and winter they ought not to be over
By now, whether they were sown in F
or March, or propagated from cut
early April, the plants should be re
their next step. This, the summer tre
may be in cold frames having a north
or by plunging the pots in soil outsid
planting them out, and lifting them
autumn. My experience with S
favours the plan of plunging the pot
soil in a sunny position, open and aw
any overhanging trees. The plants
have two stoppings to promote a bus
from about the middle of May to the
June, and ought never to be allowed to
dry, especially should this point be
at the time the plants flower, as if
quickly drop their blossoms and, ob
there will be no berries in the autu
September, Solanums should be hou
a temperature of about 50 degs. Fah
degs. Fahr. be maintained. Where S
are planted in the ground and hav
potted in September, the greatest ca
be exercised in the matter, shading th
from bright sun, after the operatio
they have accommodated themselve
pots. Such plants are larger tha
grown in pots right along, and m
specimens if well looked after at t
they need potting. Young plants rai
seed this spring can be procured from
ready for potting on, and these may
upon to furnish nice berried s
next winter.

Annuals

So soon as annuals that have be
either broadcast on beds to assist
flower garden display or on prepared
for cutting can be handled, they sh
thinned out to the respective distanc
to be required to allow for the dev
of individual plants. It is a great m
let them remain crowded thickly t
the size and quality of the flowers are
seriously affected, and the duration
also considerably shortened. Wh
are troublesome, it will be found adv
mix up a goodly heap of fine woo
adding thereto a fair proportion of
dusting the beds all over with the s

The Poppy Anemone

Grassphalte Hard Tennis Court laid at Boughton Mount, Maidstone

GRASSPHALTE

HARD TENNIS COURTS

This ideal court being porous and having no surface displacement solves the vexed question of maintenance and never requires any watering or rolling.

GRASSPHALTE HARD COURTS, Ltd., St. Stephen's House, Westminster, S.W. 1

Telephone: Victoria 1572

A corner with bold effects in Mendip Stone **By Gavin Jones**

THOUGHTS

The gardens of England both great and small are strewn with home-made "rockeries." Some of these, where the owners are plantsmen, make good homes for rock garden plants, and in the Spring they are a blaze of colour like a painter's palette. But would you have a painter's palette on your wall in preference to one of his creations? Will you let your local builder design your house for you in preference to an architect? No! Then is it wise to let your gardener design your rock garden? Has he any knowledge of geology? Has he the training or intuition to know where to show strength and where to be light, where to be bold, and where to throw shadow? If you want a rock garden designed by a master go to a master, and he will give you a picture that will entrance you and be a joy to you for ever. His pictures do not lose interest when the novelty of possession wears off, they grow on till you love every line and colour of them. This is the test of work that lives.

GAVIN JONES The Nurseries LETCHWORTH, HERTS.

A Grower gives his Secret to the World of Gardeners

"KULBAK"

(Registered Trade Mark)

"*KULBAK*" *MANURE* is the result of over fifty years experimenting and testing by a scientific and practical grower and its action is quicker and more certain than that of any other manure on the market.

"*KULBAK*" *MANURE* is not a Fertilizer but a Plant Food complete in itself and requires the addition of no other manure whatsoever.

"*KULBAK*" *MANURE* does not force growth but compels perfect and healthy development which ensures successful resistance to all pests.

TESTIMONIALS.

I have been greatly troubled with Slugs, and Insect Pests, but to my great surprise I did not lose a single plant this Year. This I attribute to "*Kulbak*" Manure. Everything I grew gave greatly increased Crops and this was particularly marked in the case of Tomatoes.

We specialise in Carnations and before we used "*Kulbak*" Manure we were manuring our beds every fourteen days using a well-known Brand. Now we only use "*Kulbak*" Manure about every four months, and we get better Blooms, Longer Stems and Healthier Plants which are practically Pest Resisting.

Before using "*Kulbak*" Manure I was badly troubled with Garden Pests, but since I have treated my soil with it not only have I had Finer and more Healthy Blooms, but almost a total lack of insects of any description. This I can honestly attribute to your preparation.

Originals can be seen any time at the Head Office.

AN UNIQUE MANURE

and complete food for all Plant and Vegetable life

"*KULBAK*" *MANURE* purifies and enriches the soil and acts exactly the same on every form of plant life and on every kind of soil.

"*KULBAK*" *MANURE* contains no soluble acid of any kind.

"*KULBAK*" *MANURE has no smell, it is clean to handle,* simple to use, and is equally effective in both indoor and outdoor cultivation.

The use of "*KULBAK*" *MANURE guarantees*

Perfect Flowers Healthy Vegetables
Luscious Fruit Lawns like Velvet

Where can I obtain?

THE difficulty of not knowing exactly where you can secure some special line needed for the garden — probably recommended or seen elsewhere—is easily overcome by utilising the services of "G.I."

Considerable care over a number of years has been given to tabulating information on all aspects of gardening that shall prove of assistance to our readers.

Write us, therefore, when you want to know where to obtain any seeds, plants, shrubs, horticultural implements, sundries, or other accessories to the garden that you do not see advertised in our pages.

Address your enquiry, with stamped envelope for reply, to—

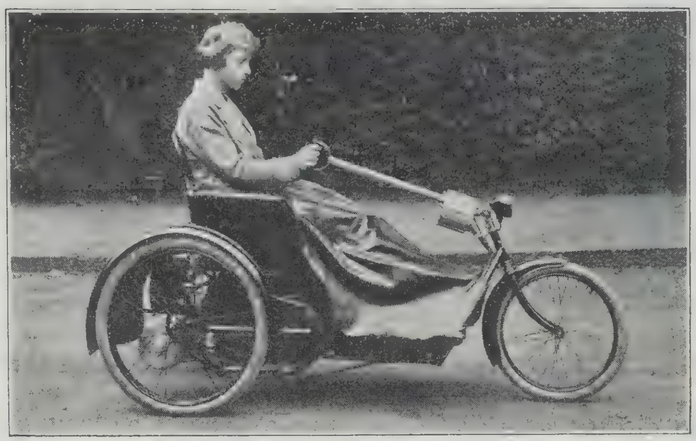
Enjoy your Garden or Park to the full in Comfort



ARGSON ELECTRICALLY PROPELLED TRICYCLE.

IN Tricycle construction the ARGSON Electrically propelled Tricycle is ideal. The seat is well sprung, is luxuriously upholstered in leathercloth and very roomy. Combined with a spring cushion you get arm-chair comfort.
A silent and smooth running mechanically propelled vehicle which can be relied upon to negotiate whatever gradient may be encountered, and to function with a clock-like regularity. Carrying an 85 ampere hour capacity, 24 volts storage battery, the "Argson" has a radius of 30 to 35 miles per charge.
It is so simple to operate, that even a child can drive it. The steering, speed and brake controls are combined in the tiller with stirrup handle, and the user can go at graduated speeds from one to nine miles per hour at will.
Suitable for either Town or Country.

Price **£95 : 10 : 0** ex Works.

SPRINGY AS TURF BUT BETTER THAN TURF

ALL the advantages of well-conditioned grass courts are available on Gaze's Hard Courts *the year round.* You become independent of the weather because they are perfect for play a few minutes after even heavy rain. Gaze's All-Weather Courts are being laid in ever-increasing numbers. Here are some recent orders:—

Four courts for British American Tobacco Co.

Two Courts for Hull University.

Four courts for Borough of Twickenham—a repeat order.

Two courts for Sir Conan Guthie.

One court for Sir Alexander Rogers.

Four courts for "Swakeleys," Ickenham, Middlesex, by instructions from Foreign Office.

Our 48-page Art Catalogue gives full information regarding Gaze's Courts, also particulars and illustrations of Model Gardens, Stone Ornaments, Garden Furniture, etc.

Write or 'Phone for a Copy, or call at—

New Cardinal Flower
"Lobelia The Bishop"
(Award of Merit. R.H.S.)

A remarkably vigorous plant, growing 4½ to 5ft. high, stout stems supporting magnificent spikes of large flowers of a glistening vermilion scarlet colour. The main spikes have flowers for 12 to 15 inches of their length open at a time, and when these are almost finished, from each stem a sheaf of lateral spikes is produced maintaining a display for 8 to 10 weeks.

Strong plants **5/-** each; **55/-** per dozen.

TWO BEAUTIFUL NEW SEEDLING CHRYSANTHEMUMS

"Mrs. W. N. Webber"

Undoubtedly the finest early-flowering pink yet introduced. Charming and unusual shade ; bears very large sprays of fine flowers from July to October ; wonderfully effective for borders. 3 feet to 4 feet ; makes enormous plants. One of the most vigorous sorts ever raised ; stands rain and sun well.

"Mrs. F. G. Smeardon"

Rich deep bronze, unique colour ; most attractive ; bears fine heads of very bold, solid blooms ; excellent for pots or borders. Same parentage as above variety —*viz.*, Sept. White x Horace Martin.

Every Chrysanthemum grower should grow these most distinctive 'Mums.

Well rooted plants, 2s. 6d. each, 27s. dozen, from the raisers

"Blue for Beauty"!

THAT'S WHY
NO GARDEN IS COMPLETE WITHOUT
delphiniums!

BLUE EYES, blue skies, blue seas . . . and the glorious Delphinium excelling them all! Hewitt's famous Warwickshire Nurseries send the finest thoroughbred Delphiniums to add their graceful beauty to gardens the world over.
Not without reason have these wondrous plants earned so many Gold Medals.
Truly they are veritable Rhapsodies in Blue.

A GARDEN has failed to attain its highest degree of loveliness without Hewitt's worth-while Delphiniums. Though their slender, tapering spires suggest delicacy in their very charm, Delphiniums are quite easy to cultivate. Send NOW for Hewitt's big Delphinium Catalogue, giving particulars of the finest selection available in this or any other country. Prices are most moderate, having regard to the supreme quality of the plants.

SEE US AT
CHELSEA
SHOW

OUR Prize Delphiniums will be on view at this popular Show. Attendants will gladly answer all enquiries respecting them, or any other of our plants, bulbs, seeds, etc. Expert advice as to cultivation also gladly given, free of charge or obligation.

THE CHELSEA OUTLOOK

The lay-out of the Show — Prospects of an extremely interesting exhibition

Wednesday, May 22nd, the gates of ielsea will once again open to the blic. There is, surely, a magic in a Show—exhibitors and visitors are on o of excitement. Flower shows come), and are forgotten, but Chelsea is ssic annual show fixed in the memory er. This year, owing to the backward following a hard winter, the Show fer from its predecessors in the flowers re to be seen. In past years it has question of how can we keep Tulips or Chelsea, this year the question is an we get them out in time. This e may see Daffodils at Chelsea, while owering Alpines will be more abun- han ever. Then, following the keen ions, there are surprises in store in k gardens.

number of applicants for space has d increased. This year the entries ex- hose for any previous show, and in f the abnormal season there is every pt of an extremely good exhibition.

Y-OUT OF THE SHOW

general lay-out of the show will be l to that of last , but several ations have ade.

order to meet at demand for the first large e has been en- by the addition further 3,500 r feet. An extra e has also rected on the o accommodate ibit which has brought over the United by an en- iastic lady r. This ex- t (described on 34) is designed some idea of a and fauna of alifornian r and Redwood and it is quite k anything pre- ly staged at a, and should prove very interesting. The special tent for Roses, which was so much criticised last year, is situated on the lawn next to the Orchid tent. New and noteworthy plants submitted to the Committees will be arranged in a marquee adjoining the Orchid tent, those plants that receive awards being placed on a special table. This marquee will also accommodate small exhibits from Fellows. The National Tulip Society will hold its annual exhibition on the second day of the show in a marquee at the end of the Rose tent. Groups of shrubs in the open will occupy more space than formerly, and will extend down the main avenue opposite the gardens where hitherto glasshouses have been shown.

Glasshouses and exhibits of heating apparatus and summer-houses will be grouped together in Monument Road, and it is thought that this arrangement will be convenient for visitors, and consequently popular with exhibitors. Hard courts and several exhibits of the heavier type of garden furniture will be situated at the hospital end of the main avenue. Light garden furniture and exhibits of garden ornaments will be arranged on the lawn. The remainder of the exhibits of sundries, including those which occupied the tent on the lawn last year, will be in the sundries avenue.

An exhibit at Chelsea brought from America designed to give some idea of the flora of the Californian deserts. (See also page 334)

Scientific and educational exhibits

The scientific tent will contain not only exhibits illustrating some of the activities of the Society's own experimental garden and laboratory at Wisley, but also exhibits from the East Malling Research Station, the Cheshunt Experimental and Research Station, the Rothamsted Experimental Station, the Seale-Hayne Agricultural College, and the Royal Botanic Gardens at Kew and Edinburgh. All visitors should make a point of seeing these exhibits, most of which will illustrate the results of recent research on horticultural problems.

Information bureau

Throughout the show members of the Society's staff will be in attendance at the Information Bureau in the Scientific tent to give information and advice on cultural difficulties and the means of controlling pests.

Catering

The catering will again be in the capable hands of Messrs. J. Lyons and Co., and there will be two refreshment tents in the Ranelagh Gardens and one on the lawn. At the first-class refreshment tent in the Ranelagh Gardens there will be an à la carte as well as a table d'hote service.

Post, telegraph, and telephone facilities

There will be a post and telegraph office at the Hospital end of the main avenue, and besides several telephones for local calls there will be one for trunk calls.

New plants for certificate

New plants, flowers, and fruits for certificate must be entered with the Secretary of the appropriate Committee by 4 p.m. on Tuesday, May 21st, and new Bearded Irises for submission to the Joint Committee of the Royal Horticultural Society and the Iris Society must be entered with the Secretary of the Committee by 3.30 p.m. on Tuesday, May 21st. Entry forms and any further information which intending exhibitors may require can be obtained on application to the Secretary, R.H.S., Vincent Square, London, S.W. 1.

Correspondence

Contributions to these columns are invited, but the Editor is not responsible for the views expressed by correspondents

Rhododendrons and the hard winter

To those who, like myself, are growing or propose to grow Rhododendrons, both species and hybrids, in a small way, a few notes on the effect of the recent severe winter on these plants in an inland and not specially favoured garden may be of interest.

Firstly, all the species, of which about 30 different series and sub-series are represented, including plants of Barbatum, Cinnabarinum, Campylocarpum, Falconeri, Fortunei, Fulvum, Lapponicum, Neriiflorum, Thomsoni, and Triflorum groups, have come through with flying colours, two small Virgatums, K.W. 6272 and 6273, too rashly put out in the open last year, being the only deaths, and Neriiflorum having the leaves but not the growth buds slightly frosted. The rest have not turned a hair, despite 30 degs. of frost followed by a strong sun for many days, while the ground was frozen a foot deep. Practically all the plants are growing amongst tall Birches, which give a certain amount of shelter, but, even so, many plants of the common Ling and Heather in the same situation were killed to the ground.

That the majority of the hybrids should weather the storm was to be expected, but it is gratifying to find that Loderi is quite unaffected, and even the rather tender Beauty of Tremough has survived the ordeal with damage only to the growth buds caused by the combination of sun and frost, though two hardy old hybrids in an exposed position have lost all the flower buds from the same cause.

Japanese Azaleas of the Kurume type, beyond slight frosting of the leaves and some of the flower-buds, were quite undamaged.

Seeing that the winter was the severest for 34 years, causing damage to some of the hardiest of shrubs, this is a very satisfactory state of affairs, and I, for one, shall feel no concern for the safety of the plants in any future winter. Arthur E. Farrell.

Birchenholt, Crowthorne, Berks.

Pear Doyenne du Comice

Who has not, with reverence almost, eaten his first Doyenné du Comice Pear of the season and realised how great a gift is this superlative fruit; individual taste largely governs the appraisement of a fruit, and quite naturally, too, but I have yet to meet the person who enjoyed Pears at all—and who does not?—who could remain "cold" after so delicious a feast.

A great continental pomologist, M. André Leroy, recommended that to preserve this Pear as long in use as possible—its season is November—it should be gathered early and dry, and after the fruits have been placed in store, handled as little as possible. Mr. R. D. Blackmore said, "This is, to my mind, the best of all Pears."

The tree is a regular, if not a heavy, cropper; and succeeds in any form; so great a fruit, however, certainly deserves to occupy space on a south or south-west wall, and here may be culled fruits of fine form and noble size. When ripe they are lemon-yellow, with a suffusion of pale apple-green, generously dotted with pale brown russet, and particularly so round the eye and stalk.

The yellowish-white flesh is delicately perfumed, tender, rich, sweet, and melting—a kingly food.

This, one of the aristocrats of fruits, was raised in the garden of the Comice Horticole at Angers, and the original tree first fruited in 1849. Ralph E. Arnold.

Sweet-scented Mignonette

In my old home in Ireland years ago we had beds of Mignonette deliciously scented and most prolific, so that one could "pick and pick, and come again" all the summer. Then giant kinds came into fashion and the smaller vanished.

I tried the new sorts in variety and found them good for the greenhouse, but not nearly as satisfactory out of doors. They "came" badly, produced a lot of green, and only a few large flowers not nearly as sweet as the old one. I searched in vain for it.

Last year in the catalogue of Messrs. Dickson, of Chester, I found quoted "Common sweet-scented Mignonette." I got a large packet, and was delighted with the result. I gave some seed to a young gardening friend, who wrote later asking where she could procure more, as it had flowered all the summer and been so sweet. Perhaps some of your readers may like to try it.

I might mention that Mignonette requires lime in the soil in some form and a very firm seed bed. K. M. R.

Tilmanstone.

Propagating Lilacs

Your correspondent's note, page 264, on Lilacs is interesting and instructive. One will much appreciate "Scottish Gardener's" method of propagation in print in these columns. Interested.

[It gives me much pleasure to accede to the request of "Interested"; although the process is, or ought to be, familiar to all hardy plantsmen who have to do with shrubs. Peronally, I prefer to propagate Lilacs from cuttings rather than from layers; but both are equally sure methods of increasing the Lilac. The process of layering does not call for a detailed description—it is familiar to everyone. With respect to cuttings, there are two methods. The first, and least troublesome, is to take the cuttings early in August, when the wood is half ripe or thereabouts. These may be inserted in a prepared bed in a cold frame, well watered in, and kept close for a short time. Afterwards plenty of air may be given, and 80 per cent. of the cuttings, or even more, will emit roots. These young plants can be run out into nursery lines in March, and they will be ready for transferring to their permanent quarters in the following autumn. Or, in August, the cuttings may be put in under a north wall in light and sandy soil, burying the stems deeply until, in fact, only a pair of leaves is above ground. They must be inserted very firmly—if "Interested" has ever handled cuttings of the rambler Roses he may follow the procedure. From 60 per cent. to 70 pe will emit roots, and in March the plants can be put out in a nursery b in nursery lines. The second method pagating the Lilac by means of cutti this. Lift a few medium-sized plants a as the foliage drops, pot them up, and them in a cool greenhouse until Feb Then they may have a little more hea 55 degs. or thereabouts. Growth quickly follow, and the young shoots w very freely indeed in a temperature degs., and more quickly, of course, if bottom heat can be given. When well the young plants may be put into 4-in and removed to a cooler house—even, to cold frames. Such plants may be ha off and planted out at the close of well manured ground, watering them, weather be dry, until they are estab Such, briefly, is my method of propa the Lilac. Of course, such plants wo suit those nurserymen who rely up abuse of the gentle art of grafting, generally speaking, quite unsuitable in order that very large plants may be (and cheaply) produced. Such are any price.—A Scottish Gardener.]

New Lachenalias

Several years ago I secured a nun Lachenalias from the late Rev. Joseph Vicar of Whitewell. I see by the which appears on page 145 of the Ma issue of Gardening Illustrated tha Lachenalias were further developed late William Mauger, of Guernsey, a this work of development still contin the name and address of the growers given.

Varieties are named in the abov tioned article, such as Sunset, R Glow, Aurea, Leiden, Rutland, Mont and Goldfinch. I have been unable t anyone to whom I could apply fo varieties, and therefore am writing t you will be good enough to send me th and address of the party or parties wh article states are still continuing th of development. H. F. du

Winterthur, Delaware.

[We have referred this inquiry to Davenport, the author of the article i tion, and he replies:—The late Mauger's business (and, more or l horticultural hobbies, too) is being ca by his son, who bears the same na Lachenalias are grown in his private at "Les Rosiers," Doyle Road, which go out for distribution are de by "W. Mauger and Sons, Br Nurseries, Guernsey." Some of tho tioned in Mr. du Pont's letter were Whitewell. Some are the result of sequent developments.]

Wanted: A Gladiolus guid

I have recently received two G catalogues from widely separated within the Empire. One advises me "English Grown" and give employ Englishmen, yet in the body of the c it is stated "some of the foreign vari be imported bulbs!" In America no i bulbs can be sold, but must be g think) for two years by the impor least that is what I gather from t logues which reach me. In the oth logue a variety is thus described:—

"This is a grand seedling. . . . Th is a deep Orchid shade, entirely fr streaks or flecks, although each flowe a large, richly-coloured blotch."

Can any of your readers who are lovers tell me what colour to exp should decide to order one of the bu

Double bunch Primroses

nder if I could appeal to your readers the correspondence column for in- on on the following point:—I have rs been interested in the double Prim- nd have a collection of the various s-white, scarlet, crimson, lilac, yellow, c. Now there have come into my hands lants of double Polyanthus. So far n learn these are of a strain called the cord Hybrids, and were reared by a man, Cocker, of Aberdeen. There is le creamy-white, a purple showing a spot at the base of the petal, a r also showing the spot, a rose-pink claret beautifully margined white, and crimson like a dark Wallflower. f these I found in an old nursery gar- nd a day or two afterwards in a garden I found others. The old man tells me there were eight varie- first and that he bought them all, but t most of them.

the gardens I have seen I have never cross these. Cocker's nursery is now up, and the foreman in one of the nurseries in Aberdeen tells me that ybrids have now disappeared. He there may be plants in old gardens d there. As these are of very great and do not appear to be difficult of in gardens where the ordinary Poly- thrives, I wonder if any of your know of the varieties, or if they found ay extensively to the south or into ds of enthusiasts, or if Cocker reared hen there was not the same wide in- n these flowers. I understand they ll named by him, and am trying to an old catalogue of his herbaceous

REV. WILLIAM MURDOCH.

deenshire.

Rosa gigantea

Preston's note on this Rose in your h issue is interesting to an Australian England. Near Melbourne Mr. Clark, an enthusiastic amateur, raises many new Roses as a hobby, and has presented some 30 proven novelties during the last 20 years to our Australian Rose Societies in aid of their funds. Some of these rival the best of the English Roses we import, and are found in every garden, but what brings me to write is that he more and more uses gigantea as a parent because he finds its progeny practically immune to mildew and dieback, and of fine foliage.

In his climate, with sharp frosts in winter, but none lasting through the day, occasional great heat in summer, and generally a dry, bright atmosphere, gigantea flowers profusely and continuously all summer, and rambles to a great height like a Wistaria up an old Pinus insignis.

Its progeny is, naturally, nearly all climbing in habit, but Mr. Clark has in recent years successfully tried the experiment of again crossing the hybrid with the first bush Rose parent, frequently an H.P., to reduce its exuberance to bush Rose habit. He finds that the gigantea foliage and constitution are strongly prepotent, and that he gets in the usual percentage a vigorous bush type of medium petalage, exceptionally hardy and disease-resisting. It should be worth while to test out his plan under English conditions.

FRANK CLARKE.

St. James' Court, London, S.W. 1.

The Snowy Mespilus (Amelanchier canadensis)

A tree now flowering with remarkable freedom in many parts of the country. The abundant racemes of white flowers are produced before the leaves are fully developed, followed in July by small dark purple or black fruits. Flowers of this tree are frequently sent to this office for identification

Condition of ornamental trees and shrubs

The extremely severe winter and spring has dealt kindly with several species I have in my garden in one of the eastern counties, usually the coldest and most exposed to the bitter east winds and frosts. Double Cherry (Cerasus James H. Veitch) is a picture full of bloom just before the leaves are maturing; Magnolia grandiflora hardly touched and will soon be in its normal appearance; Cydonia japonica full of bloom in N.W. position on wall, a treat to admire; Laurustinus, an old favourite, bravely blooming since December last; Hydrangea budding freely and not perturbed in any way. The Prunus Pissardii were also a joy a month ago, full of bloom, Honeysuckle showing signs of a wealth of bloom in three weeks' time, and Jew's Mallow (Kerria japonica fl.-pl.) a wealth of yellow blossoms.

The Rose bushes—about a dozen—I pruned directly after the spell of sharp frosts, and never looked better. With no severe frosts I shall have Roses in a month, the bushes and foliage looking stronger and better than I have seen them in other seasons.

Mentioning flowers, the quiet spring has treated them kindly, Hyacinths King of the Blues being superb, also mixed colours. The Daffodils have been likewise, truly a good season for them. Blue Auriculas, a charming border, and Pansies a perfect blend of mixed colouring and very fine flowers. I have not lost a single shrub, the only damage I have sustained is the Veronica partly killed, but is going on well now. W. G. B.

Witham, Essex.

Primula pulverulenta, Bartley Strain

May I add my testimony to the hardy nature of this Primula, which is now in full bloom here? I cover it and my other Primulas with Bracken Fern in the winter because they grow in the wettest and coldest part of the garden. But they are in well-drained, heavy loam, and never dry at the roots, even in a drought. Amongst them are Meconopsis Baileyi and integrifolia maxima, now showing fat buds, and Celmisia spectabilis, also full of buds. They all share the Fern covering in winter, which keeps them dry round the crowns and (as I think) discourages slugs.

Let no one think these lovely Primulas are delicate. They are as strong as they are beautiful. (MISS) K. RICARDO.

Berghmote, Wimborne, Dorset.

Plants for the miniature garden

In my article, entitled "Plants for the Miniature Rock Garden," appearing in your issue of May 11th, I must plead guilty to an error.

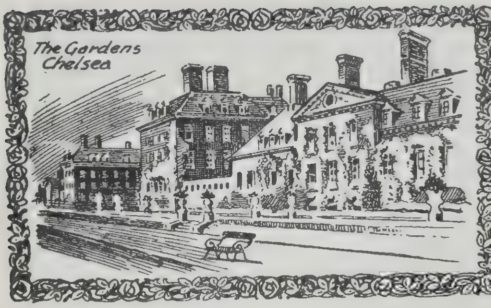
By what mischance it occurred I do not know, but the slip in question is that Edraianthus is meant for Helichrysum frigidum.

Edraianthus serpyllifolius is a trailer with lovely blue flowers, quite different from the shrub meant. WALTER S. MYALL.

Thame, Oxon.

Saxifraga x Godseffiana

There are some newer hybrids with yellow flowers in the Kabschia section of Saxifrages, but one which still stands as one of the best is that named S. x Godseffiana, also called L. C. Godseff, and S. x sancta speciosa. It has for its parents S. sancta and S. burseriana speciosa. Farrer speaks highly of it on account of it "ranking very high among the yellow Burserianas." It is very hardy, flowers freely and early, and is always welcome when it blooms, either in the rock garden or moraine. It is one of the earliest, and is very pleasing with its little mounds of spiny, greyish-green foliage, and, when it blooms, gives an abundance of clear lemon-yellow flowers on short red stems and in loose heads. It appears to like full sun with me, and appreciates a little lime in the soil. It grows quite freely. I observe that the parentage of S. x Godseffiana is otherwise given as Elizabethæ x sancta, but I have adopted that given by Farrer in "The English Rock Garden." S. ARNOTT.



THE
CHELSEA SHOW
MAY 22–24

The Quadrangle
Chelsea

The promise of Chelsea

THERE has been more than a glorious uncertainty about Chelsea this year; for many exhibitors these last few weeks have been a time of gnawing anxiety as to what to concentrate upon for Show purposes, or whether their precious charges would overcome climatic handicaps and reach the top of their form because nothing but perfection is good enough for Chelsea. Whilst some have had necessarily to modify their exhibits, and a melancholy few are *hors de combat* entirely, the large majority of exhibitors, as usual, have come up smiling, and their triumphs will be all the more astounding and pleasurable to visitors who to a lesser degree have encountered delays and disappointments in their own gardens. It will be the old familiar Chelsea "bun," therefore, with a seasoning of special surprises.

For instance, G. Bunyard and Co., whose exhibits of fruit are so consistent right through the year and always instructive, will be setting up their display on entirely novel lines likely to set tongues wagging if not heads nodding in approval. As usual, there is promise of a glorious display of Irises from this source—always a feature of the Show. Th. Rivers and Son, the pot fruit specialists, are hoping to stage their usual display of Peaches, Nectarines, Plums, and Figs. Fruitarians will not need to be reminded that the Brothers Laxton are once more leading us into temptation with the one and only display of champion Strawberries. The vacancy for a fruit sampler for the Show period is already filled. Their novelties are Acquisition and Primate and other notable new fruits like Duchess of York. The Duke and King George will be in the collection. What Mrs. Dykes' exhibit lacks in size it will make up in distinction, and connoisseurs will find among her natural clumps of the famous Dykes Irises some choice new seedlings if the weather is propitious. The Roses of F. Cant and Co. will include among such popular ramblers as Excelsa, American Pillar, and Scarlet Climber their new seedling Pillar Rose, Promise, which secured the N.R.S. Certificate of Merit last summer. Among specimen standard Polyanthus will be La Reine Elizabeth, Locarno, Superba, Orange Perfection, and others. Two new seedlings in the group of standards and half-standards are Mrs. Hilton Brooks, a salmon Hybrid Tea and excellent bedder, and Mrs. Harvey Cant, a cream Hybrid Tea with conspicuously beautiful foliage. No need to remind B. R. Cant and Sons of what's in a name when it comes to Roses. It was, surely, a genius who called their last summer's Gold Medal Rose "Souvenir of the Old Rose Garden," a piece of nomenclature that is absolutely irresistible. You have to plant a Rose with a name like that, and when are remembered its broad petals, soft pink within and silvery without, its strong growth and old-world perfume, no wonder a big demand for it is anticipated this June when it goes out in pots. With it will go Joan Cant, also a Hybrid Tea of a delightful salmon-pink inside, rich pink outside, thick-petalled flowers well formed and deliciously perfumed. New seedlings not yet in commerce will also be shown. Allwood's exhibit will be in three sections. One will include among all the popular kinds of Perpetual-flowering Carnations their 1929 novelties, Wivelsfield Buttercup (yellow), Guy Allwood (pink), and Rapture (silvery-pink). A second triangular bed of Border Carnations, Perpetuals, and Allwoodii alpinus will show novelties of the latter in Pan (blush-pink), Pixie (white), and Puck (white with deep eye). Sweet Wivelsfield, the Allwoodii-Sweet William hybrid annual, is to be shown separately and in variety. Engelmann's Carnation novelties are mainly four, and special prominence will be given to a very striking variety named Sunny.

Among the hardy plants there is promise of a variety of new Lupins. Prichards are bringing a lot for display in the open in addition to their herbaceous and Alpine groups under canvas. Downer has many new colours, and is expecting blossom to be exceptionally fine. Waterer's most notable varieties will be Afterglow, Orpheus, Wargrave Blush, Wargrave Blue, Magnificence, Iolanthe, and Golden Fleece, all novelties of their raising. Constant Nymph, shown for the first time last Chelsea, will reappear and enchant beholders as before. Their Rhododendron exhibit, which we all look for, will be shown this time near the embankment entrance to the main tent, and among new introductions their Mother of Pearl, a pearly-white form of the grand Pink Pearl, will have pride of place. Others are Prince of Wales, a very fine late-flowering bright pink, and a new pure white variety, sweet scented, and described as a great improvement upon Geoffrey Millais and G. Hardy. An exhibit of trees and shrubs will contain Enkianthus campanulatus, Acer californica aurea, Pyrus Aria lutescens, and bright-foliaged Conifers. New hybrid Lupins as well as masses of Lilium regale will intersperse Hewitt and Co.'s large exhibit of modern Delphiniums, including the well-known Mrs. Townley Parker, Joy Bells, The Bishop, Rose Marie, Violet Queen, and especially Monarch of Wales, which secured the A.M. at Wisley last year. rvia is one of these. A simple and prac-
garden which anyone could put into a
en conveniently is the end in view.

Mr. Ingwersen will exploit Sussex sandstone suggestively planted rather than bedded out in the usual grand manner for Show purposes.

His table exhibit will delight the lover of rarities and unusual plants.

Baggesens', whose monastery garden was so much admired at the last Chelsea Show, and who make a speciality of old-time gardens, will be building a typical old Devonshire garden. When the visitor feels surfeited with the opulence and colour of "showy" gardens, let him turn aside for this little bit of old England. G.

The "Blahs" at Chelsea

Of all visitors to Chelsea Show few are more widely known or so inescapable as the Blahs. In train, tube, bus, and on our thoroughfares generally the species is not exactly dormant, but as soon as it comes into the environment of "Chelsea" or any other floral exhibition it expands, it unfolds, it glows, it gushes, and, as many an unfortunate exhibitor will tell you, it bores insufferably. Can nothing be done to suppress its vanity and bad manners? Is there no redress for visitors and especially for tired exhibitors when they come up against these Blahs? Their voices are, as a rule, loud, and always persistent and penetrating. Buttonholing the exhibitor or his harassed assistant these folk will never let go until the recital of what they have accomplished with Meconopsis Baileyi or some such thing down at Little Windover is complete. They will prate of the exhibitor's plants that they somehow failed with—and why was that? Or they must tell him of the rare things (purchased from a competing nursery) that they have planted lately, and how wonderfully they are doing. Of this, that, and the other thing that they have bought or intend to buy, and what would he advise as to cultivation. Thousands of other visitors are pressing upon the exhibit, some with definite orders to place, but still the Blahs blah on, and one marvels at the stoicism and courtesy of their listeners. Irresistible, all-conquering, all unaware of the fierce hate they are generating as they pass through the show expressing loudly their acclamation or condemnation, the Blahs blissfully proceed, and where they lead others turn back lest there should arise a desire to do some bodily injury to these incorrigibles, or at least inflict a blow upon their inordinate inflation and conceit. The pest is probably at its worst among the Roses. You successfully deploy from a couple at one Rose group only to find yourself sandwiched between other examples at the next, until, no matter where you turn, they seem to be all over the place, and you can neither see nor smell the Roses for the Blahses. Their chorus swells from defamatory libel to lavish eulogism, but the smile of the custodian of the stand is as that of the sphinx. He has probably noticed afar off an obscure person quietly entranced in his flowers and referring frequently to the catalogue, which means business and an excuse to break away from the Blah person who has him in thrall at the moment. Whether you are doing the Irises, the Alpines, the Carnations, the Orchids, or some other popular section, one or more of these ubiquitous couples will be at your elbow—or rather their elbows will be at you, shovelling you away from a good view of the exhibit that you have secured by orderliness and patience. Out in the open among the formal gardens their loud talk goes on. They sweep all before them. Whoever may be in consultation with the exhibitor is brushed aside unceremoniously, the while they point at, or even poke at with stick or parasol, some feature of the garden that calls for their inquiry or criticism. It is when they reach the rock gardens, however, that they really get into their stride, going it fortissimo and with a sort of hear-what-we-have-to-say-about-this air, a this-is-*our*-Chelsea feeling. Their stamina and the tenacity of their vocal cords are amazing. Nothing subdues them except the Scientific tent, which they occasionally find themselves in by accident. The sundries are to them rather *infra dig.*, but they will at least unbend to them to the extent of asking the long-suffering standholders for all manner of sundry information upon the whereabouts of the secretary, the telephone, the luncheon tent, the stand of a competing exhibitor; and this year they will possibly add to their questionnaire: "Oh, where is the blue bulb from Chili?" And when they ask where is Death's Valley it will require a restraint almost superhuman to withhold the obvious retort, and to be guiltless of "blahsphemy." R. L.

Some sidelights on Chelsea

TWELVE full months have passed in review since the last gathering of the gardening clans at Chelsea, and the foremost event of the horticultural calendar is upon us once more. Once more in a few days' time the curtain will be lifted on the supreme pageant of the year, the Show that draws flower-lovers from every corner of the kingdom.

The stage is set in the Chelsea Hospital Gardens. Gargantuan marquees fill the time-honoured arena to the right of the main entrance, and to these men come with an interminable stream of lorries that disgorge flowers to make this Chelsea surpass anything that has before been seen in the famous grounds, for it is universally admitted every year that the current Show is the finest that has yet been held, the only differences of opinion being as to how many lengths it is ahead of the last. For the few days preceding the opening the marquees are a hive of ordered industry, as the plants and flowers, each one the result of months of tender care and devotion, are arranged in their appointed places in the ranks, while outside among the formal gardens and in the all-important corner devoted to the rock gardens work will have been going on for the past month or so.

HOW PLANTS ARE PREPARED FOR CHELSEA.

Work for Chelsea, however, does not begin in May. In many cases no sooner is one show over than plans and often preparations for the next begin, while many things must take more than a year to prepare. The Sweet Peas, the Schizanthus, and all the annuals, for instance, will be sown on a date in the previous summer or autumn that will have been worked out with minute exactness by calculations based on years of bitter experience which will have taught exhibitors almost to a day how long it takes their plants to come to perfection.

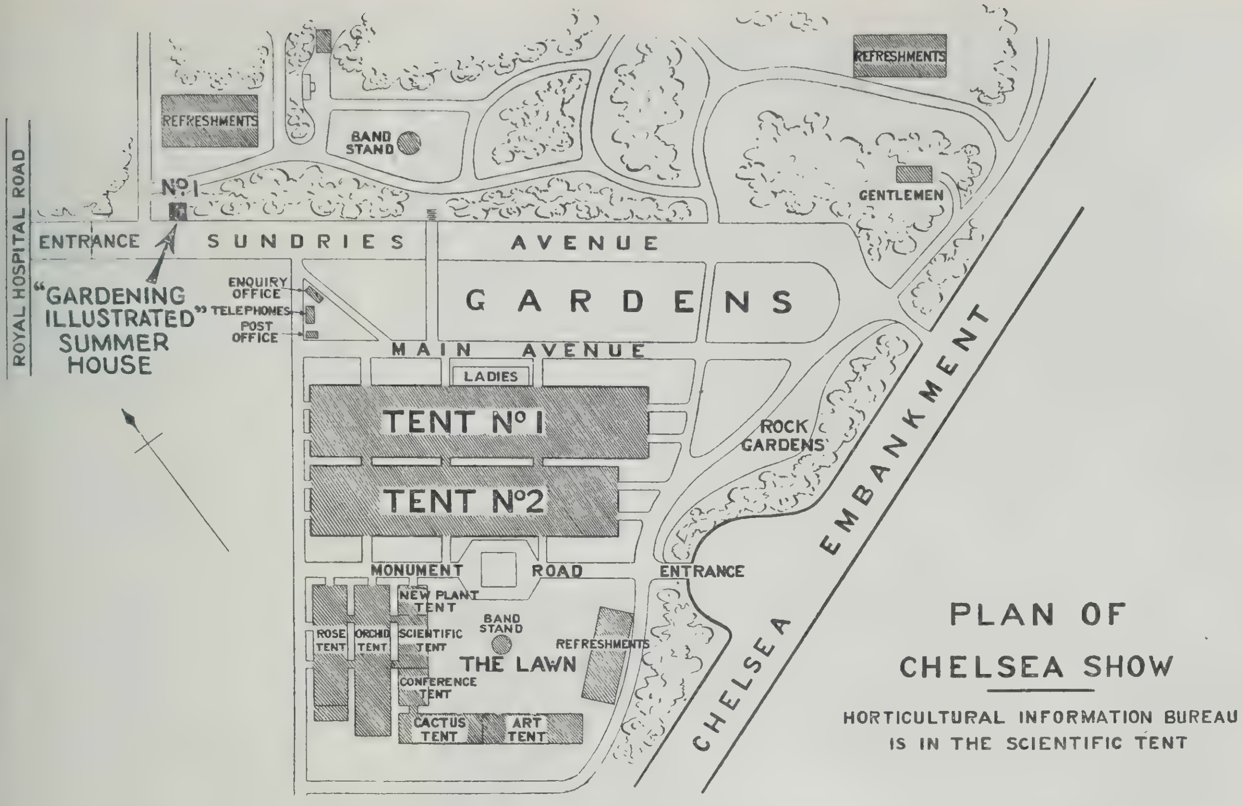
With the Sweet Peas, which are one of the most famous features of the Show, you are not so slavishly dependent on the vagaries of the weather, or in such fear of a treacherous May frost, as in the case of Schizanthus or other pot plants, when you are showing the plant as a specimen and so have but the space of a few days in which each plant is at its best. Sweet Peas you can delay by pinching out the earlier buds if you can force them on soon enough; Schizanthus, on the other hand, you build and mould as they grow by stopping, pinching, and training, and however much you may strive to force or to retard them at the last moment by adjusting the temperature and ventilation of their houses, you are still practically dependent on your original accuracy in choosing the date of sowing; and, even then, a weak spring sun may throw you out, or too long a spell of good growing weather in the winter may bring you in too early.

There must be few, indeed, among those that voice their wonderment at the banks of flowers who realise a fraction of the anxiety they have caused in the production. You hear often enough how people wish they could get their Clarkias half the height of Sutton's; how somebody else can never get his or her Begonias to the size of Blackmore and Langdon's; or four, five, and six blooms on a Sweet Pea stem like Dobbie's; but the months of skilled work that have been put into their production and the eleventh hour doubts and qualms that have attended their staging are points not quite so fully appreciated. Another thing that is difficult to realise is the scale on which things are grown. Take, for instance, the display of Carnations that won Mr. Engelmann the Sherwood Cup the other year for the finest exhibit in the Show. Literally thousands of superbly grown blooms were requir build it up; and in the same way vast of glass must be devoted to the Sweet and Roses, and so forth, each exhi which contains such myriads of p flowers. Carnations, however, do not r quite such special preparations as ma the other things, for they are usually g under glass, in any case, and flowere whole year round. Roses, on the other have to be forced. By grafting in Ja and growing on rapidly, say, three o new shoots on each stock, buds selecte fixed time before the Show and allow develop can be timed to produce a hal flower for the appointed date. Thou of Lilies, Delphiniums, and genera baceous plants are forced, too; while for the increasingly popular Iris g planted by Bunyard and other firm have to be shepherded along, probably under glass and some in the open. and Irises . together one expects complete confidence from Wallace, t Tunbridge Wells, who are always su as exhibitors of Lilies.)

Some of the Primulas even will nee tle forcing, others merely a little pro nursing, but Chelsea is one of the ve occasions on which one sees large tions of Primulas in flower together, a amount of care is worth while to members of such an interesting fam gether. Nearly all the vegetables, of and fruit need special treatment; and of the flowering shrubs will be forc at least, forwarded under glass. Tuli the other hand, are always a probl Chelsea. Even when retarded as far a be they are the first things in the S show signs of wear, and many fall op far and start dropping their petals second day.

Outside, as we have seen, work st the beginning of the month, and, al the formal gardens will all be plann down on paper beforehand, much st pends on how things go on the site— weather that helps or hinders th structional part of the business, and condition of the plants that arrive to fin

Go early and avoid the crowd



PLAN OF THE CHELSEA SHOW

Note "Gardening Illustrated" Summer House is No. 1, Sundries Avenue

ngoff. The planting, indeed, may make or formal garden. You may have a really onceived plan and carry it out with ex- e workmanship, and then quite easily ilit with hothouse plants not properly died off, that soon begin to show signs dress. Not that it is easy, of course, u you be bound to stock the beds from le glass to get a natural effect; but it is t the grower's while to tax his ingenu- t the utmost in order to have his plants ig perfectly happy on the opening day alculated to remain so for the two s trial to follow. That its inhabitants sone and all look at home is one of the actors that make for the success of arden. Considering all the difficulties ir path, then, the formal gardens are ig achievement at Chelsea. In some of azy paving, the Thyme and creeping ig might have been born and bred in evices you see them in.

t; to the rock gardens you must turn, n, for the most popular corner outside nts, if not in the whole Show. You nly to watch the jostling crowds that nbly surround them to realise the num- devotees they attract. Correspond- ly a rock garden is probably the most ending thing to put up at Chelsea.

still have your worries about plants, er and above these you have the grow- ar of not being able to do yourself til under exhibition conditions; you are santly dependent on the purveyors of ck, and more dependent than anything erhaps, on the weather. Further, you ave next to nothing cut and dried be- ou start work—everything must be ld under the strain of the last three ek, and finally you have a site that would lost enough to send the uninitiated away forted at the outset. Yet, in spite al this, the rock gardens fully merit the ron they receive. They are a triumph, ully; and two years ago this fact was given official recognition by the award to Mr. Whitelegg of the Sherwood Cup for his rock garden. Even so, there was an extremely close runner-up in Colonel Gavin Jones, and competition is bound to be very keen again this year.

Enough then of preparations and their attendant strain. On the morning of the 22nd they will be a thing of the past. Exhibitors will already have had a day's comparative rest—from physical labours, if not from suspense—while the judging was going on. The weather usually smiles on the Show. The first of the stream of visitors will pass through the turnstiles at 8 a.m., and the Show will open under a cloudless sky (?). There is no other month than May that shows you Nature in the full bloom of her newly-perfected youth, and no other month that could replace it as the season for Chelsea. The air is warm but fresh, a faint breeze stirs through the young green of the trees down the "Sundries Avenue," which is the first thing you come to through the main entrance. Often the opening day seems the first day of summer, as you sit in the drowsy heat of the afternoon listening to the scarlet-coated band. But there is ample shade in the leafy grounds; and if the rock gardens get hot in the full sun there are the formal gardens, half under a canopy of branches, and the Art tent away among the trees of the park; while the tents are always cool.

From 8 till 12 on the first day of the Show is to be reserved this year, as it was last, for Fellows of the Society. Then at 12 o'clock fashion will flock through the turnstiles. Chelsea, in fact, is the one occasion when a flower show is as much a rendezvous of fashion as it is a Mecca of the gardening world. Is it to be wondered at that few who have once been can resist the old lure of the tents?—the smell of trodden grass mingling subtly with the scents of the Lilies, the Sweet Peas, and the Strawberries?—the aisles of colour stretching as far as the eye can reach, walls of blue Hydrangeas and glowing Begonias, banks of Delphiniums and scented Roses, misty clouds of Sweet Peas and spouting bouquets of Carnations, and cool gardens of Irises and Lilies?—or the tinkling streams and the vivid little patches of Alpines on the rock gardens? It is not a surprising thing that people come again and again. Even during the strike of 1926 they flocked to it; and each year seems to see an advance on the last.

All hail, then, to Chelsea, 1929.

F. C. S. R.

Sale of exhibits

Exhibitors are reminded that, under the regulations, they are forbidden to sell plants, flowers, fruit, vegetables, sundries, pictures, or other articles for removal before the close of the Show, *i.e.*, 5 p.m. on Friday, May 24th. As visitors do not always realise that exhibitors are not allowed to sell articles for immediate removal, cards giving the above information have been printed, and any exhibitor who wishes to display such a card may obtain one on application to the Secretary.

The Secretary would be obliged if exhibitors would take steps to see that all the attendants at their exhibits are familiar with the regulations.

Catering for exhibitors

New arrangements have been made with the caterers with a view to try and improve the refreshments facilities for exhibitors.

The caterers will provide on Monday and Tuesday, May 20th and 21st, an abridged *à la carte* luncheon in the Ranelagh Gardens enclosure, and a 1s. 6d. tea.

It is hoped that the exhibitors will make good use of these facilities, as it was only by special pressure that the caterers were persuaded to extend the show refreshment facilities.

Horticultural sundries at Chelsea

Not all the horticultural public realise the full significance of the above heading, though some of the keener enthusiasts do. Just as new creations of flowers and plants take the public fancy, so various sundries, some of which are patents, registered designs, or new and improved creations, are essential to the raising and well-being of horticultural subjects, flowers, fruits, or vegetables. Some appeal to the beauty and adornment of the garden. It would take pages to mention all the numerous sundries essential or beneficial to modern horticulture, embracing, as they do, the simplest things to the most complex inventions, the result of brains and the highest scientific research. Labels, plant supports, essential tools, motor and other mowers, spraying machines, watering pots, systems of netting, modern glasshouses, heating, fertilisers, manures, insecticides, fungicides, fumigating materials, shading, watering cans, peat, leaf-mould, loam, sand, rocks, garden ornaments, summer and other houses, pergolas, preserves, pictures, and a thousand and one other things. All these sundries, like the flowers, fruit, and vegetables, are, in most cases, new creations, improvements on those formerly in use, and have been created or invented by the various vendors. Where they are not new they are still the best of their type, nothing better, so far, having been invented to supersede them. Let the general public realise that there is something or many things that are desirable, essential, or beneficial to them in their gardens, or of personal benefit to themselves, and after seeing the flowers they should not fail to go round the Sundries Avenue and sections to see what really does appeal to them. The sundriesmen are there to demonstrate and show the advantages of their particular wares, and as nothing may be purchased to be taken away (according to the very strict rules of the R.H.S.), an order must be given for any purchase made, and the sundriesman will send or deliver it to the address stated. It is remarkable what ignorance of the sundries sections still remains in many up-to-date garden owners. They have no idea what labour-saving or efficient tools and machinery can be had at Chelsea Flower Show. Sometimes, quite by accident, they see what they have been looking for for years, yet it may be the fifth or sixth year since its introduction. A tour of the great tents and grounds is not complete without a look round the sundries. Since no purchase can be taken away during the Show and every article has to be sent, the taking of names and addresses occupies more of the sundriesman's time than when he simply handed over the article, as was the custom a few years ago. Visitors to the sundries generally leave their purchases till the last moment and are sometimes disappointed to find a crowd round the stand at which they want to make their purchase. A train has to be caught and so they do not see the wanted article demonstrated. Usually a look in Gardening Illustrated will find the advertisement of the particular stand, and price list can be written for. While it is always the flowers first and the sundries afterwards, often customers to the sundries come in waves and it is not always possible to attend to all in the time. This should be borne in mind and visits paid either earlier in the day or later at night when congestion is not so great. To those who have not paid the Chelsea sundries a visit before, a careful look round is recommended, and if they do not come away full of wonder at the advance in horticultural appliances these lines will have been written in vain.

DENERS' PRIVILEGE TICKETS.—Any pro- al gardener, or any employee in a private, public, or botanic garden, nursery, or seed establishment may obtain one non-transferable ticket, admitting on Thursday, May 23rd, at half-price on application direct to the Secretary not less than three days before the show. All applications must be made on special forms, obtainable from the Secretary.

BATH CHAIRS cannot be admitted on the first day of the show, but on the second and third days they will be admitted between 8 a.m. and 12 noon on payment of an extra 5s. for each chair, which covers one attendant.

Chelsea news and views

Forthcoming events

MAY 23RD.—THE GARDEN CLUB.—Mr. J. R. Koning, Director of Parks and Gardens in Amsterdam, will be the guest of honour, and, after dinner, will give a lecture on Holland with ancient and modern gardens, illustrated by lantern slides. The dinner commences at 7.30 p.m.

MAY 23RD.—NATIONAL TULIP SOCIETY.—Annual Exhibition in a marquee at Chelsea (near the Rose Tent).

MAY 23RD.—KEW GUILD.—The Annual General Meeting and Dinner will be held in the Clarendon Restaurant, 1, 3, and 5, Broadway, Hammersmith, W. 6.

Mr. W. Hales, A.L.S., the Chairman of Committee, will be in the chair at the meeting, which will begin at 6.30 p.m., whilst Mr. John Coutts, the President for 1929-30, will preside over the dinner, to commence at 7.30 p.m.

JUNE 5TH.—NATIONAL CARNATION AND PICOTEE SOCIETY'S MEETING.

JUNE 6TH AND 7TH.—THE IRIS SOCIETY.—The Third Annual Show in the new R.H.S. Hall, at which deputations will be present from the Continent and America.

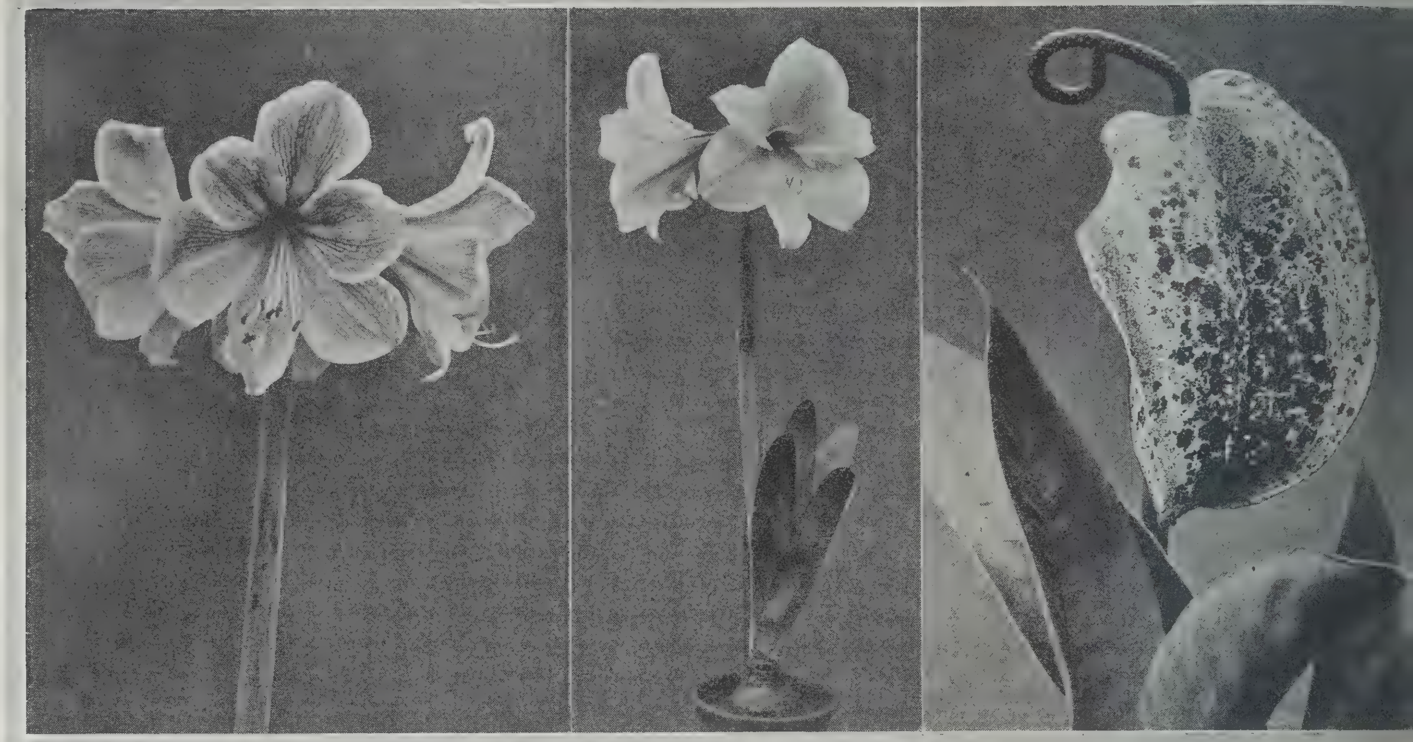
The Death Valley, with all its vivid theatrical grimness

Proposed Association of Garden Architects

Meeting at Chelsea on May 23rd

THE long hoped for and much needed association of garden architects has now been formed and will henceforth be known as the "British Association of Garden Architects," with its headquarters (for the time being, at least) at 9, Gower Street, Bedford Square, W.C. 1.

The formation of this Society has been made possible by the enthusiastic and determined efforts of capable younger members of the profession, who are not only anxious that the practice of garden design shall receive public recognition as a profession and worthy of the highest place in its affections, but that the whole trend of modern design shall be intelligently reviewed and discussed by its exponents, and the standard improved and exalted to a place with the fine arts.



Hippeastrum seedlings (coloured and white) and a new Anthurium with large, broad spathe mottled blood red

This is the aim and object of the Association, and to achieve this, the following agenda has been compiled :

The object of the Association is to organise all those engaged professionally as garden architects and to do all things possible to further their interests and those of the public, and to set up a standard of garden design to meet present day needs. To achieve these objects steps shall be taken :

(1) To organise all those engaged in the work.

(2) To arrange periodical meetings for the members for exchange of ideas and information.

(3) To arrange lectures for the benefit of members and others interested in the work of garden design.

(4) To judiciously survey all matter appearing in the Press, either daily or periodically, on the subject of garden design.

(5) To arrange periodical exhibits on garden design at various centres as agreed by the Committee.

(6) To take steps to secure that a training centre should be established where students can obtain the necessary knowledge of the principles of garden design in relation to horticulture.

(7) To found a circulating library for the use of Members.

(8) To prepare sets of lantern slides for use by members in lecture work and to loan suitable slides to Horticultural Societies in the country.

The consequent result of thus organising and collecting the resources of the profession would be a greater understanding and appreciation of the art of garden design, and ultimately the country would be the richer for the higher fulfilment of its practices.

The Association will hold a general meeting between 3 and 4 o'clock in the Conference Tent at the forthcoming Chelsea Flower Show on Thursday, May 23rd, for the purpose of discussing the policy of the Association, and for the election of members. All persons who desire to attend, and who, by reason of the work upon which they are engaged are virtually entitled to do so, are cordially invited. Would-be attendants are requested to apply for formal invitation to the Secretary, B.A.G.A., 9, Gower Street, Bedford Square, W.C.1, giving full name and address and occupation. Admission to the meeting will be by ticket only, and the Conference will commence at 3 o'clock sharp.

It is to be hoped that all who are professionally engaged in this work, whether architects, designers, or landscape gardeners, or principals, or employees, will give their whole-hearted support to this movement and will make every effort to attend the meeting, which is of the utmost importance to all so engaged, as well as to the art itself.

Remarkable floral groups in the New R.H.S. Hall

Progress due to cross-fertilisation—Evolution of the white Hippeastrum

A REMARKABLE group of Hippeastrums (Amaryllis) was exhibited on Tuesday, May 7th, at the Royal Horticultural Society's meeting by Mrs. Burns, North Mymms Park, Hatfield (gardener, Mr. Wright).

For many years past Hippeastrums have been popular plants, and deservedly so. The late Sir George Holford, Veitch and Bull, of Chelsea, and Kerr, of Liverpool, did much to popularise the plant, but on no previous occasion have so many white forms been collated, forms which rivalled the coloured in size and shape.

The whole centre and greater part of the group was composed of well-grown plants and well-shaped varieties, all with pure white segments, pure white from a distance, but on close scrutiny suspicions of green could be detected in a few and a vestige of pink in
others, while on the flanks were pla
number of coloured forms.

Present-day Hippeastrums are prac
all products of hybrid selections. The e
parents were such species as equestre a
variety major reticulatum, vittata, an
bably the allied species, aulicum, bea
as species, but hardly comparable wi
forms now cultivated, all of which hav
obtained by cross-fertilisation of the
hybrids and by further crossing of se
varieties so obtained.

The green of equestre and the red
of vittata can still be traced in man
gradually the perianth segments have
broadened and the colours have been i
fied until to-day we have a race of
which for size, symmetry, and depth of
entirely surpass the originals.

White has always been desired, b
difficulties in its production, that is,
elimination of colour, have been greate
those of increasing existing tints.

The evolution of the "whites"
Mymms Park collection was comn
over 20 years ago by Mr. Fielder, the
dener on the estate. Mr. Wright, th
sent head gardener, took them in hand
15 years ago, and, commencing wit
Fielder's base, has gradually develope
as shown. The original plant and
successive forms have been cast awa
narrow in their segments and too
colour to rank. Their work had been
but their blood is still present.

Selection still goes on, and several fo
the group had been marked by Mr.
to cross and re-cross in the hope o
further improvement.

On the whole, Amaryllis, to keep t
garden name, are of easy cultivation.
a number of seeds are obtained in eac
sule, and may be expected to flower
three years of sowing. Occasionall

other groups at the same meeting may cited as showing the progress due to rilisation.

Nemesias, shown by Sutton and Sons, ding, and the collection of Anthurium rianum by Sanders, of St. Albans.

e former, memory need not go so very k to realise the great improvement in flower, floriferousness, and the quite nts of colour produced. Grouped as nts were, they were a striking testi- as to their value for colour schemes rden decoration.

alise the advance made in Anthuriums must be made of the earlier forms of erzerianum grown half-a-century ago. t as they were, they are now quite in size and colour. All are deriva- om one species and its varieties. A. hildianum, distinguished by its crim- ottling on a white ground, was ob- etween the type and its white variety, in the imported species, the earlier were hardly comparable with those of

cherzerianum, varieties were shown pathes nearly orbicular, the colour from pure white, through pink and o deep crimson, while in Rothschild- forms were present with vivid mottling ashes of colour previously unknown. ral the spathes were as broad as long, all the improvement in size and colour e out of proportion to those who re- the originals. E. COOPER.

Prunus nana Firehill

enchanting little shrub, which was n Award of Merit at the last show of H.S., is a native of Roumania, and wild on the foothills of the Car- s. The buds are scarlet rather than nd this is when it is seen to the best ge. The flower is of a fine pink which makes the other pink double s look blue.

Roumanians say "the hills are on hen it is in bloom, and this is why I lled it Firehill. According to their ing, Ferdinand, who was a good , it is the wild Peach of Roumania, w says it is a fine form of Russian , or Prunus nana.

e not seen it taller than 2 feet in nia, where there is much lime in the a very hot sun in summer, but with rich, dark soil, the old plants are inches. It suckers very freely in a t suits it. Possibly the fact that it covered my ground with suckers as ative land (where it forms a carpet) de it run up a little taller.

erves to be in every garden, and, how- rd the winter, presents a mass of n spring. I hope to arrange for its tion. ALICE MARTINEAU.

Gardenias

he elegant stove evergreen shrubs, hining green leaves and beautiful, perfumed, white flowers, are very or hand or buttonhole bouquets, and are well worth growing wherever accommodation can be given them. The double forms of G. florida and G. f. Fortuneana are well known and the best to grow for the supply of flowers. Although they may be grown moderately well in a greenhouse, they really need stove temperature to do them justice.

Gardenias thrive in an open compost consisting chiefly of fibrous loam and peat, and should be re-potted annually until the plants reach a large size. Under good conditions of cultivation, plants may be grown to quite a large size in a season, but it is always wise to retain and grow on a few old plants, for while young plants produce the finest flowers, old plants yield a greater quantity of moderate sized flowers suitable for buttonholes. A moist atmosphere and frequent overhead syringings during the season of growth are essential details of cultivation, and the plants must be kept free from the attacks of mealy bug and scale. Gardenias are sometimes planted out in a central pit of a warm house, but while this system has the advantage of causing a more free growth and perhaps finer flowers, it is less easy to keep the plants clean, and culture in pots is to be recommended for general purposes.

Warwick. W. AUTON.

Sophro-Lælio Cattleya Yokohama, rosy orange, with deep ruby crimson lip

Shown by Baron Schroder. First Class Certificate on May 7th

Senecio abrotanifolius

This plant is not so much grown as it deserves to be. It is of easy culture, and the abundance of its showy, shaggy flower-heads renders it very attractive.

It is very suitable for the margins of borders or the rock garden. From the dense tuft of leaves it throws up numerous stems 6 inches to 8 inches high, on which orange-yellow blossoms form a conspicuous mass.

The plant is of a somewhat straggling habit, therefore it is best to give it room to spread, and to use it in positions where its full beauty may be seen to advantage, as, for example, a stoned-in pocket in a low position, somewhere below the level of the eye. It is a good plant for the upper parts of the moraine.

It may be exposed to the hottest sun, although it does well in shade, without perhaps flowering so freely. The plant is not fastidious as to soil. If the soil is too rich the plant bears long leaves of a rich freshness and the flowers are partly hidden, but planted in sandy, gritty soil it will never fail to bloom profusely.

Old plants should be top dressed with open material worked well in and about the plant in spring, and be divided every three or four years. As the shoots trail along the ground and root as they grow, it is increased with the greatest ease. It is perfectly hardy, and may be used with good effect near the lower flanks of rockwork, or the angles of steps in the rock garden.

H. STEVENS.

An out-of-the-way corner made beautiful

Rock Gardens: A Retrospect

THE Editor has asked me to say a few words about rock gardens, past and present. Fortunately, I am not able to give personal recollections on the subject for more than about thirty years, so shall look at two or three books and go back to earlier dates than the occasion seems to demand, in order to see where we stand now.

I have been told of a Japanese book with a title something like "The Making of Little Mountains and Hills," by Moronobu—an artist of some 300 years ago, I understand. I have asked to see a copy at the British Museum, but, after over an hour's hunt, none was forthcoming. He is the first rock gardener I have heard of giving enough importance to the subject to write on it—though somebody may dig up some Chinese or Persian MS. as time goes on.

It is a long jump to Capability Brown and his semi-disciple, Repton, of the latter part of the 18th century, but that time was probably the first period of the rock garden, as such, in England. Repton ("*Observations on Landscape Gardening,*" *1803*) said: "The numerous class of rock plants should have beds of rugged stone provided, without the affectation of such stones being the natural production of the soil." This view seems to have been shared by a host of his followers, judging by the horrible erections which continued to be the vogue until the middle of that century. It shortly began to appear, however, that a rockery on natural lines would be more suitable to the growth of a big variety of plants, and probably people were getting tired of trying to grow things on the Doréesque grottoes, fearsome arches and punctated mounds of the early and mid Victorian days. A few of these are left—to mark the days of cheap labour and our easily-satisfied æsthetic senses—and to provide a home for the survivors of the fittest, *i.e.*, Aspidiums, Ground Ivy, and that magnificent but useless snail, the inedible escargot.

By the way, it might be noted that *all* countries were not at our sorry pass, for want of guidance, in this form of garden-craft. There are those delightful Japanese "sketch-books" (a more proper name would be "text-books") which are so much more explanatory of their beautiful designs in rock gardens than any plans could be. Where the customs of tradition have undoubtedly in many ways impeded human progress, the assiduous and reverential copying of their old masters in art has undoubtedly helped the Japanese nation to its high artistic credit of the present day. Even in their modern art, the Japanese make extensive use of old forms, and one can quite see that plentiful reference to their wonderful "sketch-books" can often determine the problem of a line,
path, or contour in the garden. A
copy is a better thing than a bad cre
though copying hardly leads to great m
advancement or initiative. And it ma
safely assumed that there is not now
form of modern craft in England that
not owe something to Japanese influen

Loudon (1834 to 1850) says rockwork
made or adorned by pieces of "congl
ated gravel, vitrified bricks and scoriæ,
shells, spar, or other earthy and hard m
bodies. Such works are, in general,
looked on more as scenes of culture th
design or picturesque beauty." On

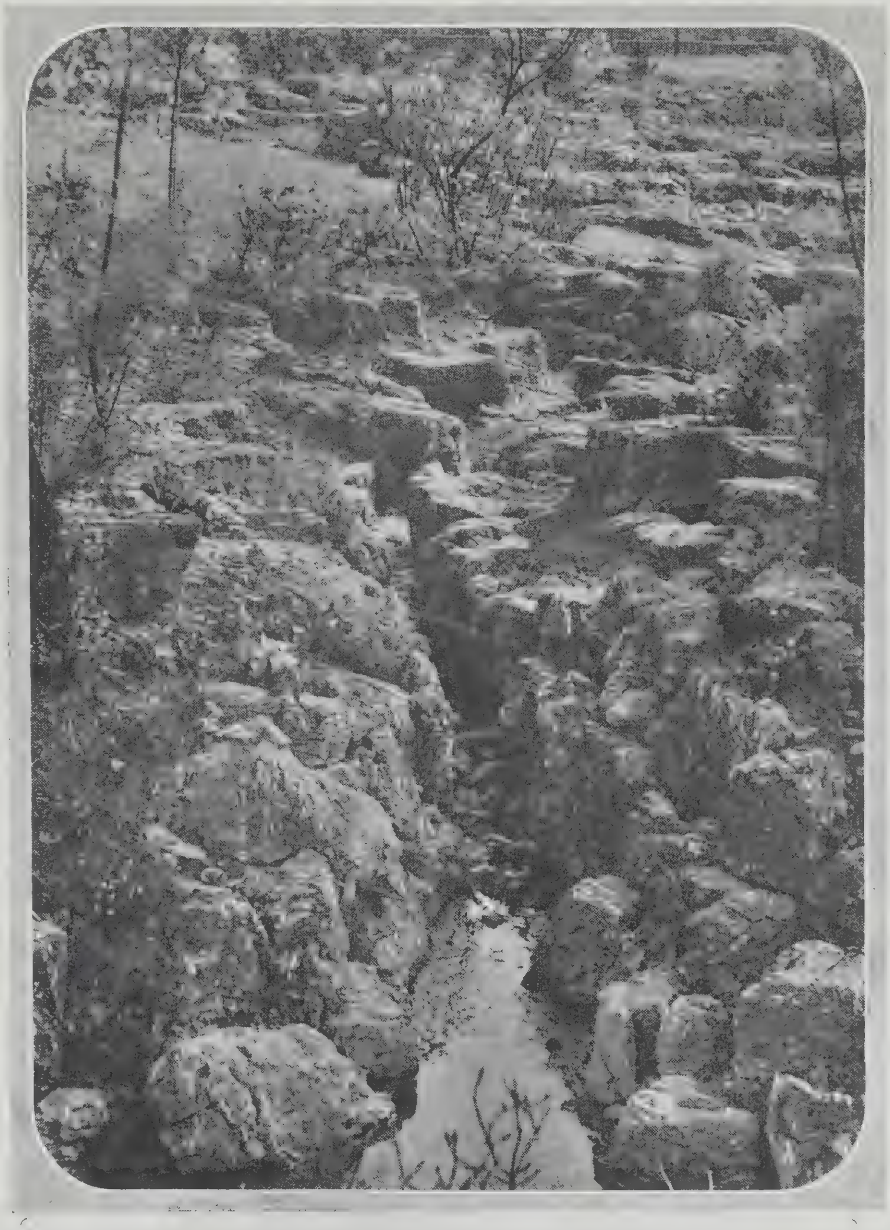
k garden is an adaptable quantity.
are even very discouraging town
, where neither grass nor border plants nor shrubs will flourish, which would still support a rockery and suitable plants. All that is needed is stone that will not blacken greatly nor become chalky, and plants which will put up a fair fight in spite of smoke and a possible lack of direct sunshine.

Probably 50 years hence our darkened squares will receive bright sunshine by means of reflectors, and we shall be able to grow Cistus and Calochortus in the depths of the "wells" formed by the walls of twenty-storied buildings. Speculation on the state of artistic development we are likely to arrive at by the end of the next 50 years makes me almost too excited to sit down and wait and see. Only last week I refused a flat with a "roof suitable for a rock garden." The cult of the alpine is becoming almost too hectic in town—though I do not see why roof gardens should not be made into rock gardens if we grow plenty of bulbs and plants not objecting to sun, wind, and drought, strictly avoiding all obviously impossible things.

J. WOOD.

[We are indebted to Mr. John Wood for the four delightful illustrations of rock and water gardens that accompany this article.—ED.]



An overflow ditch made interesting

Saxifraga crassifolia

This old Saxifraga, with its large cymes of light rose flowers in pendent masses, is useful for the rougher parts of the garden where a bold-leaved, vigorous-growing plant is required. The plants are most easy to propagate, simply lift and divide in early autumn when they become too large. An annual top-dressing of a little rotten manure is very beneficial. Although the typical plant is good and worth growing, there are numbers of varieties of this which deserve better and more prominent positions in the rock garden than can be given to vigorous-growing plants. S. crassifolia aureo-marginata, with its wonderful variegated foliage, is one of the best. Rubra has broad leaves, its deep rose flowers being thrown well above the foliage. Orbicularis is very good for a small rock garden. The leaves are of moderate size, the light rose-coloured flowers are most freely produced and thrown well above the foliage.

F. H.

Calanthes and How to Grow Them

AMONG winter-flowering plants few excel the deciduous Calanthes in beauty and utility. The name, derived from kalos = beautiful and anthos = flower, is peculiarly apt, particularly when applied to the section under mention.

The genus falls into two divisions—the evergreen and the deciduous.

Representatives of the evergreen forms are, unfortunately, rare under cultivation, though the purplish-flowered C. Masuca and the white-flowered C. veratrifolia were at one time comparatively common. Their flowers are set more closely together than those of the deciduous kinds, the inflorescence of which is an erect or arching spike, the upper portion carrying numerous flowers set clear of each other. All are characterised by a deeply cleft labellum, the fissures giving it the appearance of being four-lobed, while its base is attached to the edges of the column, forming, with the inner surface of that organ, a compressed, box-like, triangular cavity. The lip finishes in a slender, usually recurved, spur. The pseudo-bulbs of the persistent-leaved species are rather small and are sheathed by the leaf bases. In the others they are much larger, usually globosely pyramidal, and often with a central stricture.

A wild and wayward little stream joining forces with an older and more experienced one—on their way to the sea

The majority of the cultivated Calanthes are hybrids, and though 50 or more names have been applied to the different forms, but few species enter into their composition. Strictly speaking, many of the names must be regarded as synonyms, yet each form is distinct and has its own merits.

Probably no other Orchid exemplifies to the same extent the value of selecting and crossing different colour forms and varieties of the same or nearly allied species.

Practically all of them are derived from C. vestita and C. rosea, though two other allied species, rubens and labrosa, have also been used.

C. vestita is widely distributed, forms being found from India to Borneo. The flowers are white or creamy-white, with the cavity and basal portion of the lip varying from yellow to dark crimson.

C. Regnieri, from Cochin China, was at one time classed as a species, but is now placed under vestita. It differs from the type, in its stronger habit and its later flowering period. The spikes, too, are more erect, but the flower-carrying portion arches downward, and the flowers themselves are set more closely together, are slightly smaller, but more numerous, and usually flushed throughout with rose, darkest on the lip. As in the typical vestita, numerous forms occur which have received varietal and, in some cases, specific names.

Its stronger habit and slightly later flowering season have rendered it of value to the hybridist. Traces of it are seen in many of the present-day hybrids, and by its use the flowering season of Calanthes has been considerably prolonged, though this merit is possibly also partially due to a form of vestita known as gigantea.

C. rosea, labrosa, and rubens are less in habit and have smaller flowers than vestita. In each the flower-spike is erect and the prevailing colour is rose, rubens being the darkest.

C. Veitchii, the forerunner of Calanthe hybrids and still, perhaps, the most largely grown, was raised by Messrs. Veitch between rosea and vestita, and distributed as far back as 1860. It and the later hybrids may be said to have usurped the place of the species.

Derived from white and rose flowered species, Veitchii varies considerably and exhibits every gradation of rose.

Crossed again with one of its parents, vestita, C. Sedeni was produced by Messrs. Veitch in 1878. The original form is now probably lost sight of, as the parents, but in different varieties, have been used by several raisers.

Bella, Alexanderii, Halli, Harold, Mylesii, Oweniana, Phœbe, etc., are all forms of Sedeni, each differing in some respect, colour, size of flower, length of spike, duration, etc., and from a gardening point o
are worthy of distinguishing n

ces from a Cornish garden

E plants, at any rate, of Primula eniana have survived being divided, are just showing, which leads me to iat the few fragments I sent to other en the autumn may be doing the same. tainly a surpassingly beautiful plant, igh authority wrote me the other day survival in cultivation depended on my efforts, so I am pleased, I wish it could be induced to set seed. writing the above I have heard that any rate, of the plants I sent to has survived, and that not the best am sure, for the other was sent to a

de Pompadour, the double crimson e, is looking better than it did last d is flowering sparsely, but another ust be tried for it, for evidently it is sued yet.

t to the spring flower show at Truro, ood show it was, despite the weather. Lord-Lieutenant's exhibit from s was, as usual, the best thing there, one wishes that the parentage of the seedling Rhododendrons had been stead of the non-committal " seed-" placed under most of them. There any beautiful things, and it is some- vidious to make a comparison, but ys which appealed most to me were hybrid of fastigiatum or impeditum blue Augustinii. This, so far as I er, has reached the height of 3 feet to 4 feet, and has lovely blue flowers intermediate in size between those of the parents. Besides this there were some very notable exhibits, Mr. Boscawen's flowering shrubs, Mr. P. D. Williams' hybrid Rhododendrons, Mr. Barclay Fox's species, and Miss Wingfield's spring flowers, to mention a few.

Miss Lavender Williams had a wonderful double purple Primrose and a beautiful old rose Anemone, which were both awarded a medal by the R.H.S. deputation.

The Warrington Park garden in North Cornwall was not represented, which was a pity, but its owner was busied with the election, and the other gardens in those parts had suffered badly from the frost and sent some lamentable exhibits.

The southern gardens, on the other hand, escaped almost scot free. I was staying in one of them, and had a pleasant couple of hours in another, and even the most tender plants were unspoilt. But even these were backward. No bloom of Rhododendron Aucklandii was shown, and only one bit of Embothrium coccineum, and that was not fully out.

Myosotidium nobile, the Chatham Island Forget-me-not, was well shown, and in the garden where I was staying there was a fine group of it with self-sown seedlings coming up round the old plants. It appears to appreciate a half-shady place with rich soil mixed with sea sand, and, if possible, Seaweed as a mulch. The other garden visited in the west really belongs more to the grand old gardener who has looked after it for more than 30 years than to its legal owner. The two hours I spent with him passed so quickly that it did not seem half the time, and I had to hurry back on my two-mile walk more rapidly than was pleasant to be in time for lunch. Not only did he know and love every plant in the garden, but he had the keenest artistic appreciation of the effect of light and shade, and of the place whence each shrub or tree showed at its best. He enjoyed the stem and bark of Laurus camphora, for instance, every bit as much as the magnificent bushes of Rhododendron, with which the place abounded.

A tree of Magnolia Campbellii, which had bloomed in February, was pointed out to me, and the fruiting Araucaria Bidwillii, but the latter was not really a good specimen, and if you wish to see it in perfect beauty it behoves you to go to the temperate-house at Kew. I am told that the cones contain no fertile seeds, and this may be so, but I should like to have examined one, for those of A. imbricata have, as a rule, a few good seeds among many bad ones, a characteristic, by the way, of Senecio clivorum. In my own garden there is a self-sown seedling of A. imbricata in a crack in the cliff of a quarry, where it has lived for many years without appreciably increasing in size. The seed must have fallen from one of a group of trees growing above.

On the same cliff there is a flourishing seedling of Thuya plicata and a number of Osmunda regalis, which, to say the least of it, is a curiosity as a rock plant.

On coming home I had to deal with some plants given me by kind friends, and this led to the weeding of a damp and shaded bed where but last year I had planted Meconopsis Baileyi and another Meconopsis from the Himalayas, probably paniculata. The former was growing well, but some of the latter had rotted at the crown. What a horrible thing is Acanthus mollis. A handsome plant, doubtless, with its large, glossy, lobed leaves and its curious inflorescence, but it is terribly invasive, and although I thought I had done away with it last year before planting the Meconopsis and Primula anisodora it was coming in on all sides. With the aid of a long-pronged fork I got up three large basketsful of its fleshy roots, but I should be an incurable optimist if I thought that it was finished with, for the aforesaid roots break easily and every bit appears to grow.

In spite of the frost this garden is very beautiful just now. Perhaps the most striking plants at the moment are a double pink Cherry almost in full flower and planted on a high bank overlooking the drive, whence one can look up at the blue sky through its flowers and delicate brownish leaves, and a bush of Rhododendron Dickson's Seedling, which, looked at across the valley, is very lovely. It is a Rhododendron I do not much admire in the hand, but isolated as it is and from a distance its great pink flowers make a beautiful picture.

" Peter the Hermit."

Eritrichium nanum, flowers cœruleum blue, extremely difficult to cultivate

The two choice Alpines illustrated on this page were shown by Mr. Roger Bevan, Crowsley Grange, Henley-on-Thames

Saxifraga oppositifolia

SAXIFRAGA OPPOSITIFOLIA is a native of this country, and one of which we are justly proud; for there are few Alpines which give a better display in the early spring months. We cannot claim all the credit, however, of fostering the Purple Saxifrage, for it is widely distributed; though many of the best forms have been found in the mountains of Scotland, Wales, Yorkshire, and the Lake District. It extends over the higher ranges of Europe and Asia (particularly the Alps), the Rocky Mountains, and the mountains of the Arctic Circle. Though occurring chiefly in the high alpine zone, where it reaches a height of 12,000 feet, it is occasionally found at a low level, as at Spitzbergen, where it grows at sea level. It appears first to have been described by Linnæus, who discovered it in the Lapland Alps in 1732.

One of the chief charms of S. oppositifolia is its prostrate habit and compact growth; and when once established, it forms a dense mat, which, in a good season, is quite obscured by a multitude of large, purple, cup-shaped flowers. Its much-branched stems are densely clothed with small, opposite, dark evergreen leaves, arranged in fours, each bearing a prominent chalk gland at its fleshy tip. The flowers are borne singly on stems, seldom, if ever, rising above 2 inches above the ground.

This is a most variable plant, and many distinct forms have been named, though some of the best are yet unnamed. In some districts many varieties are found, while one form may predominate over a large area A good white form has yet to be discovered. S. opp. var. alba is not outstanding, and its small, starry flowers, of a passable white, produced in great profusion, are easily spoiled by frost and rain.

The richest colour form is var. W. A. Clark, which has large, deep crimson flowers, arising from compact, rather upright branches. It is one of the latest to bloom, and has a strange habit of frequently producing four, or sometimes six, petals instead of five.

The rich purple flowers of var. coccinea are not red enough to justify its name. One of the largest-flowered forms is var. grandiflora, which is more vigorous than the type, and has elongated branches. Its flowers are a rosy-purple.

The typical form of the western and central Alps is var. Murithiana; the true plant has a weak and straggly habit, and does not flower freely; but a better form is sometimes sent out by nurseries under the name of var. pyrenaica. Between the true var. pyrenaica, however, and vars. major and maxima, there is little difference; all are robust growers, and have large crimson flowers. A rather erect form of pyrenaica, with very large rosy-lilac flowers, is known as var. pyrenaica superba, and comes from the Welsh mountains. A pale pink variety—var. pallida—was also discovered in Wales. Var. Rudolphiana is sufficiently distinct to be regarded as a separate species. One of the best forms is var. speciosa; of rather lax habit, its leaves are small, and its rich, rose flowers of exceptional size.

Another introduction from Wales is var. splendens, with bright, purple-crimson flowers, produced very freely. The Wetterhorn variety has a tight cushioned habit, while var. amphibia, in contrast, is a weak and straggly thing, and a feeble bloomer. Var. blepharophylla is very compact, with large, purple-rose flowers. Var. Northorstii varies from the type only in its leaves, which are arranged alternately, and thus has no right to a place in the species.

S. oppositifolia, with all its varieties, is easily cultivated. It is seen at its best in a mass on a sloping part of the rock garden, in partial shade, though it does well in full sun. The more compact varieties especially, are also seen to great advantage in the moraine. It is deep-rooting, and revels in a good depth of fairly light, gritty soil, with plenty of moisture (but never stagnant water) at the roots. In an over-rich soil, it tends to become coarse and elongated in growth, and so loses one of its essential charms. Its one drawback is an unfortunate tendency to die away in the centre when a clump has become nicely established; annual top-dressings of leaf soil and grit will counteract this to some extent; otherwise, the only remedy is to split up the clump into small pieces, and replant in fresh soil.

Propagation may be effected by division, seeds, and cuttings. An established plant resents disturbance and does not re-establish itself readily when split up unless divided into small pieces, which stand more chance of getting away. Cuttings may be taken in early summer, and seeds are best sown immediately they are ripe. Rooted cuttings and seedlings should be thoroughly established in pots before planting out in early spring.

E. K. LAWRENCE.

From Gardening Illustrated

Fifty Years Ago

How to arrange Violets

THESE charming little flowers are difficult to arrange. . . . Take an ordinary saucer and fill it with fresh Moss . . . previously well washed; build the Moss up in the form of a little mound in the saucer, keeping the fresh points of the Moss to the front, so as to make it look as fresh and velvet like as possible. The water should be well pressed out of the Moss, but enough moisture should be left in it to keep the flower stems placed in it fresh. Round the edge of the saucer Fern-fronds should be arranged, so as to hide the china, and for this purpose the tips of the common Brake Fern are best. Then take the Violet blooms and make them into bunches; say, eight or ten in each bunch; their stems should be then bound together with a piece of binding wire. The binding wire, besides keeping the stems together, makes them firm, and renders them capable of being bent into any position required. When as many of these little bunches are made as are considered to be sufficient, they should be dotted over the groundwork of green Moss. A few Snowdrops, if procurable, placed here and there amongst the Violets, produce a charming effect, and a mixture of white Violets also looks very well in an arrangement of this description. The addition of a few fronds of Maiden Hair Fern, too, tends to lighten the general effect. The Moss should be well damped every morning, and, if this be not forgotten, the Violets will keep fresh and emit their sweet perfume for many days.

The Mock Oranges

THE Mock Oranges or speci
varieties of Philadelphus are
the most beautiful of hardy
and are deservedly popular, being
rapid in growth, and beautiful in
The flowers, sometimes solitary or
a bunch, are of medium size, whi
some blotched with crimson, opening
and continuing until the end of July

There are numerous kinds, in
species, varieties, and hybrids, which
good deal in habit. Some attain m
dimensions, while others are dwarf
with rounded form; hence one may
claim that there are kinds suitable f
dens of all sizes and for almost
position in the garden. The small
growing varieties are excellent for t
garden, and even the larger types
utilised there when a bold mass is
for background.

It is essential in planting to forn
or moderately large masses of one
solitary plants in most instances los
of their beauty. Among the fuller
kinds the best-known is P. corona
Syringa. It is a native of S.E. Eur
Asia Minor, and hardy in all parts
British Isles. It forms a robust s
12 feet to 15 feet high, with slender,
stems, wreathed in early summe
yellowish white, fragrant flowers.
the most graceful is P. latifolius,

ech and African Marigolds

ltivating the French Marigold, the l aim is to secure blooms of an evenly nature, this being essential where the ard is concerned. Many growers fail re this result because they plant on h a soil in the first instance, the ending to the production of flowers less brown in colour. In poor loam, the other extreme, *i.e.*, yellow flowers defined stripe, and so it follows that st strike a happy medium, and it is better to plant this type on compara- y oor, but well dug, soil. In this con- o, one of the best results we have seen ained on an old Strawberry bed. The ere trenched in and no manure was d but the soil contained a certain of mellow richness, from previous rry mulches, which seemed just right. st flowers from this treatment were inting, yellow predominating, but by feeding, week by week, they ced the desired stripe, and many first were gained by the owner in open tion from these plants.

African Marigold requires different nt, and a rich, medium, well drained For exhibition purposes, the plants stand 18 inches apart, and the height of growth, sufficient e must be given. This plant forms nasses of roots, which lie near the , so when watering is necessary it must thoroughly, so that it reaches the s. A check from dryness at the root is se of malformed blooms. To pro- rge, perfect blooms, not more than five stems should be allowed on each t disbudding also to one bud on each

the bud formation stage, a dose of quid manure, say once a week, will eneficial, this being varied between and inorganic manures. Frequent is also advisable, but we must not go r the plants.

D. McI.

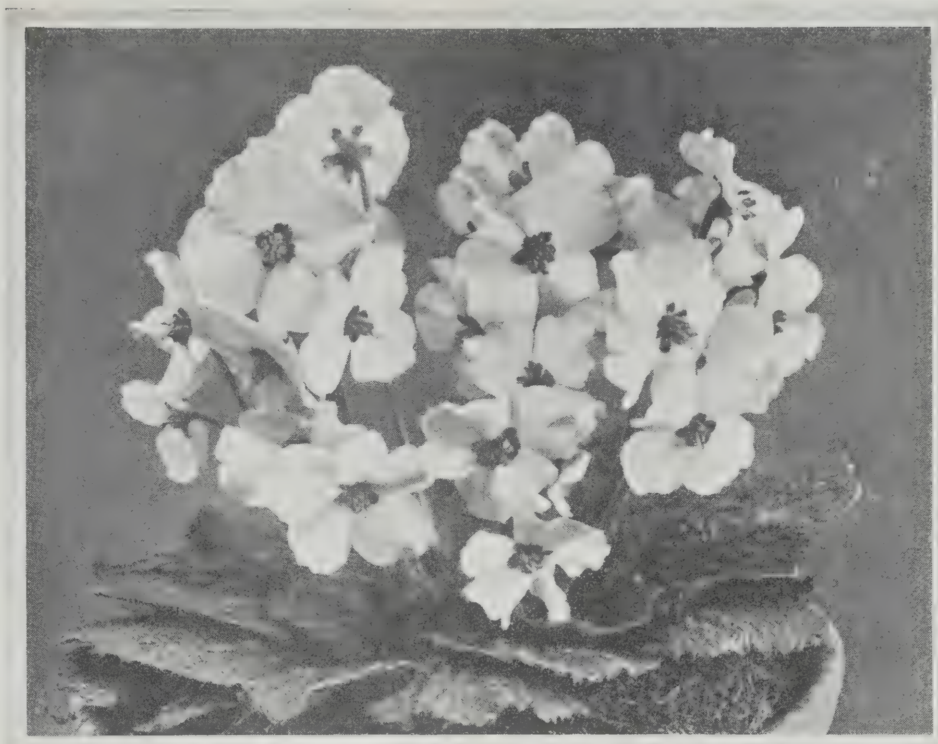
etunias for the garden

e large quantities of summer-flowering are required for beds or borders, the eautiful varieties of Petunia that are y raised from seed are most useful, of easy culture, of quick, luxuriant and most persistent bloomers. They equire comparatively little space glass. Seeds sown in pans or boxes, ced in an ordinary Cucumber frame ch, should, if the young plants be off and gradually hardened, be good l by the end of May. The purple and e varieties are very effective, and rosy are well adapted for back rows in ry borders or centres of large beds.

ms : Why they sometimes fail

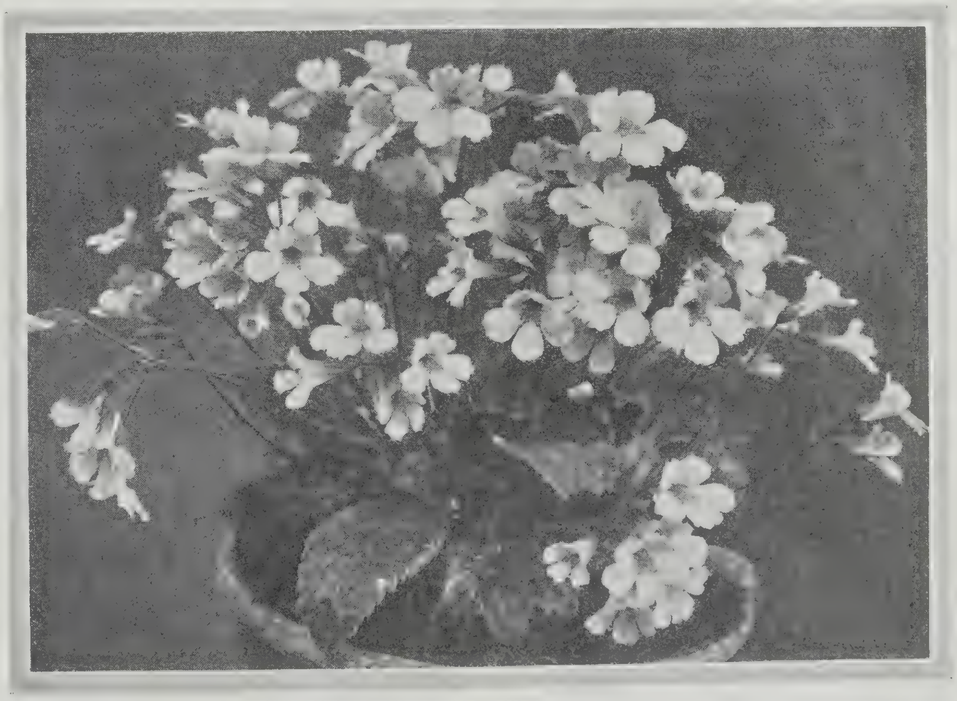
as are looked upon by many as half nnuals that may be planted out along hers during May. It would be more cor- t designate them tender annuals which genial conditions of temperature doors before consigning them to beds rders. They look robust from the ance of their foliage, when actually e not so, and should not be planted r final quarters until they have first radually inured to cooler conditions. evel in warmth and sunlight, and for this reason ought to be given place on a border where they can receive shelter from cold winds, which often play havoc among them should planting be done too early. The Zinnia is such a charming annual, however, blooming for a long time, and makes such a splendid show in a garden, that it is wise to defer putting them in the open ground until the last moment. Growing them for the first time, one does not appreciate that it is often better to put off planting outside until about the first week in June. We may be anxious to complete our planting arrangements, and get everything out of hand, but so far as these annuals are concerned it is policy to proceed with caution.

Leahurst.



Ramondia Nathaliæ (R. serbica) (Award of Merit)

A seedling shown in a 10-inch pan and carrying 12 inflorescences (others to follow), with expanded large mauve flowers. The leaves of this Serbian species are less hairy than those of the better known R. pyrenaica, and the flowers are larger



Haberlea Ferdinandi-Coburgi

A magnificent and well-flowered plant with about 30 inflorescences. Flowers Streptocarpus-like pale mauve, deeper hue on the outside of the corolla. The two Gesnerads illustrated on this page were shown by Mr. Mark Fenwick in the collection which gained for him the Sewell Medal awarded on May 7th for six pans of Alpine plants shown by an amateur

NEWS IN ADVERTISEMENTS

A new cultivator

The Holt cultivator, which is claimed to take the drudgery out of gardening, is a patent scarifier having several advantages. It is extremely light and is made with either three or five prongs, which do not damage root fibres when in use. We learn that it is securing a good sale at various London stores. Particulars can be obtained from the patentee, Mr. W. G. Holt, 168, St. Albans Road, Watford.

Signalling sundial

A very novel sundial is offered by the John Holmes and Sun Timekeepers, of Manchester Street, Brighton. It is known as the "cannon sundial," and signals the hour by the sun firing a small cannon operated by the concentrated rays through a lens. It is very handsomely made with a 10-inch brass plate.

Graded lawn correctives

Baird and Tatlock, the well-known chemical apparatus manufacturers, are offering their services for the analysis and renovation of lawns. Their lawn correctives are specially graded, and they request a small specimen of the actual lawn with the first order. This piece of sod will be carefully analysed and a mixture supplied which is best adapted to that particular soil.

A new powder spray

Some special mention must be made of a newcomer to the XL All ranks—XL All Nicotine Dusting Powder. This is an impressively fine light powder, containing 3 per cent. nicotine, for use in ordinary sprayers. Besides the usual advantages of dry spraying—elimination of water haulage, speed, etc.—it is an exceptionally efficient insecticide.

Aids to seed raising

Chase Continuous Cloches, which have proved of the utmost value in raising early spring crops of all sorts, are of more particular interest at this time of year for summer and autumn sown crops of salads, vegetables, Sweet Peas, etc., sown in the open ground, protected with the cloches and thus carried safely over the winter. At Chelsea will be also shown Chase Alpine Clips and Chase Alpine Protectors, which have proved invaluable for protecting "miffy" rock plants from excessive wet in winter.

NEW CATALOGUE

Greenhouses

Sharp Bros. and Knight, Ltd., of Burton-on-Trent. Folder illustrating their horticultural buildings and framing. Sectional drawings of the various parts of greenhouses are included.

The Flame Flower

This is one of our showiest flowering Creepers; its innumerable vermilion flowers, surrounded by an exuberance of pale green foliage, always command attention. Many of those who have tried to grow it have been disappointed at the meagre results attained.

I have seen it stated that it cannot be grown in the west of England, but this is not correct, for I have come across several good specimens in this part, covering walls with long trailing shoots and flowers. In every case they were planted on an east wall and the borders had lime rubble worked into them, which the plant greatly likes. In colder localities and in Scotland it thrives wonderfully, growing with the freedom of a weed. F. H.

Sowing small seeds

Some flower seeds are very small, and in a general way they give the most trouble. The covering of soil must be very thin, consequently the seeds are more exposed to atmospheric fluctuations than when a thicker covering can be used. The difficulty is to preserve the compost in a uniform state of moisture without frequent waterings. In a general way seeds would germinate with certainty if the soil needed no moistening from the time of sowing. Every time seeds are watered there is a slight check. The pots should be well drained, but not to the extent of causing the moisture to pass away rapidly. As long as the compost remains open and sweet that is all that is needed. Fill with nice, free soil to within an inch of the rim and thoroughly moisten the compost. Surface this with very fine, sandy soil nearly up to the rim, press the seeds in with a flat piece of board, water gently, and cover with a slight sprinkling of very fine, well-sanded soil. On this put a piece of paper, and on this a pane of glass. Place under a handlight and shade from the sun. When young, plants appear remove the paper and give a little air, increasing this gradually until the seedlings are well up, when the glass can be removed. Care must now be taken lest the soil becomes dry, and hot sun must be kept off for a time. Progress will in a great measure depend on the care bestowed in the earliest stages of growth. J. CORNHILL.

Division of Hollyhock roots

The flowers produced by those plants that send up too great a number of spikes lack the vigour and appearance which usually characterises the blooms. In all such cases the old root should be lifted in spring, and with a sharp knife split down the middle, making two portions. In some cases, where there is abundance of both head and root, there may be three or more divisions made. The soil where these root portions are to be planted should previously have been well forked over and a little well-rotted manure worked in. Although the Hollyhock is a greedy feeder the manuring should not be overdone; it is better to give a liberal top-dressing during summer than to mix a large quantity with the soil, in contact with the roots. Large amounts of water must be given during summer, which will wash down the nutritious properties of the top-dressing to the roots. The result of this treatment of Hollyhock root divisions will be seen next year in fine, well-formed spikes. F. H.

Nicotiana affinis

This is easily grown, and will take care of itself where many other less useful plants would not. Seed should be sown early in the spring, and when placed in a warm house the young plants soon appear, requiring to be pricked off when they have made two or three good-sized leaves. For this purpose I prefer a frame, as if put in pots or boxes they are apt to get dry at a time when there are many other things wanting careful attention. They will grow in almost any soil, but a good, rich loam produces the best flowers and plenty of clean foliage.

This plant is called a half-hardy annual, but I prefer not to plant it in the borders till all danger of frost is over, unless ample protection can be given. If wanted to flower early a few of the strongest plants can be potted, placing three in a 24 pot. Grow them in a house till they begin to show the flower-spikes. They can then be removed to the conservatory, where they are not only very attractive, but the fragrance of the expanded flowers is much appreciated. They are also very useful for cutting for room decoration. They are not injured by packing, as flowers are, as they are folded up wher are cut early in the morning and open evening when they are most wanted.

"Copseham," Esher. JAMES A. PA

Jasminum primulinum

This beautiful shrub does not seem very successful outdoors in this countr is not, perhaps, unduly tender, but is bloomer, no doubt owing to lack of suf sun. All along the South of France it of the commonest of garden shrubs an rich yellow of its very large, semi-d flowers, in such striking contrast to the green foliage, there affords a remar effect throughout the later winter and s months. Occasionally it may be seen well in our more westerly counties, an spring it flowered at Bettws y Coed i late Mr. E. Charles Buxton's fine old ga

J. primulinum was introduced by M Veitch in 1900 and it bloomed for th time in this country a year later a Coombe Wood Nursery. But it was treated as a cold greenhouse shrub, a such it is doubtless a remarkably good Still, in the south or south-west it oug prove satisfactory against a really sunn or rock. Along the Mediterranean it well in both limy and siliceous soils. closely allied to our winter Jasmine (J. florum), but is larger in all its parts strong grower under congenial conditi

Answers to Queries

—Queries and answers are inserted in ING ILLUSTRATED *free of charge if corre- ts follow these rules: All communications e clearly written on one side of the paper id addressed to the* EDITOR *of* GARDENING TED, *Bouverie House, Fleet Street, London,* 4. *Letters on business should be sent to the* R. *The name and address of the sender uired in addition to any designation he ire to be used in the paper. When more e query is sent, each should be on a piece of paper; the name and address dded to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

FRUIT

marks on Peaches

.).—This appears to be a bad case of ing, and may have been caused by the which they are growing having been sed until too late in the morning. In stances the whole house and every- contains becomes coated with mois- d unless air is then admitted with caution, *i.e.*, a little at first and then adually, such a result is certain. We nown houses of Grapes to be abso- ruined from the same cause. The sult may arise through gross neglect the ventilators on a sunny day, and it also arise from an overdose of arti- manure. Syringing would not harm or their leaves, providing the house osed in the afternoon immediately it ne. Such syringing should not, how- carried out before 4 o'clock at the time.

ting Strawberries

.O.).—The Strawberry is a plant that r in normal weather fails to become e and so far as we are aware there are rtain" methods by which the process omplished. The male and female n are in the same flower, so that is, of one of the reasons why this plant as such a good record in the matter of ion.

Hambro Vine

.W. W.).—You do not say what area ine is intended to cover, so we will e that it is to be grown as a single m floor to top of house. To do this, ge the leading shoot to extend as far sible until the top of the house has ached. Sufficient shoots only should on each side of the rod, and opposite ther where possible, to give you a f about 2 feet from shoot to shoot, or e known as laterals. Thus you have nal rod with laterals on each side at apart, all buds between these laterals pulled off. Tie these laterals down ly and pinch their tips out at two eyond the bunch of fruit. Should no ow this year they must be pinched at rom the rod, all side shoots developing be stopped beyond the first leaf. Your ust be to create strong, fruiting s at regular intervals along the rod, sure of the lower ones first. When in winter shorten back the leading t to within 3 feet of the last pair of branches formed this year, otherwise l have bare lengths devoid of lateral s. The Hop manure you mention is good substitute for stable manure.

and Nectarine trouble

ein).—Your specimens are affected each Leaf Curl, which is caused by the Exoascus deformans. The disease is lesome one, especially to growers of s and Nectarines out of doors. The have a lot to do with the amount of Leaf Curl present in any one season; , wet seasons the disease is always more prevalent. There is only one method of control, and we are afraid that you are too late to adopt it for this season. You should spray the trees immediately before the buds begin to swell towards the end of February with Burgundy Mixture:—Copper sulphate, 2½ lbs.; sodium carbonate, 2¾ lbs.; water, 12 gallons. The copper sulphate and sodium carbonate should be dissolved in separate wooden vessels and mixed together when completely dissolved. A second spray should be given four or five days after the first. The whole tree should be coated with the Burgundy Mixture, not excluding the whole of the buds. You will find that the leaves produced later this season will be free from the disease, but the disease will reappear each spring unless spraying is carried out. Quassia and soft-soap spray has no effect on this disease.

Vine mildew

Is it possible to have a vinery "pre-disposed" to mildew? I have a cold house which has had the trouble for three years running, and last year very badly. This winter the Vine was peeled and scrubbed with Gishurst Compound, and at the moment the Vines are beautifully healthy. I shall be very glad if you will tell me of any further steps I can take to prevent the disease before it appears, or of the best plan to adopt should it show itself. I might add that the house was thoroughly cleaned and painted this winter.

"NIL DESPERANDUM."

[We do not think that a vinery can be "pre-disposed to mildew," but badly built houses often give rise to the right conditions to enable the fungus to spread rapidly if it appears. In the case of Vine mildew great care must be taken with the ventilation of the house. Air should be given early and gradually increased as the temperature rises; draughts must be avoided. With a cold house the trouble usually becomes epidemic during a period of dull, wet weather. If the house was heated fire-heat could be used to keep the atmosphere buoyant. You have cleared up the house well, and with care you should be able to keep it more or less free from mildew this year. You would be wise to anticipate the fungus and keep the foliage dusted over with one of the fine sulphur dusting powders by means of sulphurator. If the disease becomes really troublesome you should use a sulphur vaporiser apparatus, but caution is needed and the instructions issued with the apparatus should be carefully followed.]

Marie Louise Pear not fruiting

In February, 1927, I planted a three-year-old fan-trained Marie Louise Pear against a S.W. wall, and last year it put on a good growth, but there was no bloom. In December early of last year I mulched the base with stable manure, more as a protection through the winter after a dry spring and summer, and again this year it has grown considerably and is now full of foliage, but there is no trace of blossom anywhere. The soil is not too rich, as each side of it is a Jargonelle and Doyenne du Comice, both of which bore several fruits last season and are full of bloom again just now. Can you advise me what to do to remedy the trouble?

"SUSSEX DOWNS."

[This Pear is very unreliable as regards cropping and may miss two or three seasons, ultimately producing a crop of good fruit. You might apply a light dressing of superphosphate to your soil at intervals of five weeks. Keep the tree mulched during the summer months and exposed during winter, and you should ultimately be rewarded with a crop.]

Scale on Peach trees

(Anxious).—We have had no experience with the insecticide you mention at the temperature given. The best remedy we know is paraffin emulsion forcibly sprayed on all parts of the trees, especially the undersides of the leaves. The emulsion is more effectual if mixed with warm water at about 120 degs. Fahrenheit. Repeat the process every month until the trees are free of this pest. Do not spray when the sun is shining brightly, evening or early morning being the most suitable time. You could, if you specially desire, test the insecticide you mention on a section of one tree and watch results. The winter treatment was quite correct.

Gooseberry leaf Cluster Cup

(Merlin).—Your Gooseberries are affected with Cluster Cup. Please see reply *re* the same trouble on page 322 of our issue of May 11th.

ROSE GARDEN

Marechal Niel Rose unsatisfactory

(R. W. W.).—Your trouble appears to be due to the house having been kept at too high a temperature for the Rose, and possibly over-feeding. Keep the house as cool as possible, remembering that all you need do to grow Roses successfully is to keep out frost, water only when needed, and keep the plants clean. Roses grown in excessive heat are never satisfactory, but grown in a temperature averaging from 45 degs. to 50 degs. excellent flowers are obtained. Air should be admitted with great care and through the top ventilators only up to the middle of May, when a more generous airing may be given, and some shade should be given during hot weather.

FLOWER GARDEN

Plants for a north-west border

(C. R. Coppack).—Suitable plants for such a position would include the Plume Poppy (Bocconia cordata), Anchusa italica var. Pride of Dover, Bupthalmum speciosum, Pyrethrum uliginosum, Artemesia lactiflora, Campanula lactiflora, and C. latifolia alba, Michaelmas Daisies in variety, Torch Lilies of which C. M. Prichard, Mount Etna, and Russells Gold are excellent varieties, Lilium pardalinum and L. Henryi, Helianthus Miss Mellish, Aconitum Wilsoni, Senecio clivorum, Verbascums in variety, Lythrum salicaria Perry's Variety, and Œnothera lamarckiana at the rear of the border, the front being filled in with small groups of the following:—Mertensia virginica, Spiræas, such as palmata, Davidii, Queen Alexandra, etc., Lysimachia vulgaris, Lychnis chalcedonica, Herbaceous and Tree Pæonies, Iris sibirica in variety, Trollius Orange Globe, Lemon Queen, and sinensis, Thalictrum flavum glaucum, Funkias, Fortunei gigantea and subcordata grandiflora, Centaurea montana, Sedum spectabile, dwarf Campanulas, Tufted Pansies, Geums, Hemerocallis, Montbretias, Polemonium cœruleum, Œnothera missouriensis, Geum Mrs. Bradshaw, Pulmonaria azurea, Polygonum campanulatum, Acanthus mollis, Geranium armenum, G. ibericum, G. Endressi, Epimedium sulphureum, Camassia esculenta, Ranunculus acris fl.-pl., Solomon's Seal (Polygonatum officinale), Papaver orientale var. Goliath, King George, Marie Studholme, and Perry's White, Mimulus cardinalis, M. cupræus var. Dazzler, and some of the Lupins of the polyphyllus type might be tried. Yes, the Roses would form a very suitable background to the plants, and this would admit of a path being left against paling fence as you suggest. The following Roses would be found to succeed:—Alberic Barbier, Gloire de Dijon, Reve d'Or, Paul's Scarlet Climber, and Lady Waterlow.

Good fragrant perennials

(H. E.).—The following are all good border plants, and the flowers are more or less scented:—Asperula odorata (Woodruffs), has the scent of new-mown hay, will grow in shade—it has white flowers; Wallflowers in variety, Clematis Flammula, white, charming and rustic. The Honeysuckle and White Jasmine also should be included. Lily of the Valley indispensable; Daphne Cneorum, purplish-rose, a charming plant for a rockery; Pinks and Carnations in variety; Funkia grandiflora, white; Dictamnus Fraxinella, red and white; double white Rocket, Hyacinths in variety, Lavender, Rosemary, and Southernwood are charming in a garden where fragrance is sought. Lilies in variety, Lupinus polyphyllus, white and purple; Malva moschata, white; Musk, Monarda didyma, Narcissus in variety, Pæonies (some of the newer sorts are very fragrant), Phlox in variety, Primulas, Violets, Thyme. Then there are many annual flowers which ought to be included, especially Mignonette, Sweet Peas, Ten-week and Brompton Stocks, and the Night-scented Stock is very fragrant when the sun goes down. The scented Tobacco (Nicotiana affinis) gives off a pleasant perfume in the evening also. Roses also in variety should be included in a garden of this kind.

Peacock Iris

(Miss A. E. Ross).—Yes, plant out your bulbs in good soil now to permit of their making proper growth, and also to get ripened off. Lift and repot before severe weather sets in, as this plant is not really hardy in all districts. After planting, shade from the sun for some days to permit of the plants taking fresh root in the new soil.

Mother-of-Thousands

(P. G. Y.).—The plant, "Mother of Thousands," referred to in a recent issue of GARDENING ILLUSTRATED, is Saxifraga sarmentosa, not Linaria cymbalaria, which is Kenilworth Ivy. Kenilworth Ivy is, however, sometimes referred to as "Mother of Thousands." This is one of the many instances of misleading popular names.

Hyacinths failing

I am sending with this note four Hyacinth bulbs for your opinion as to their failure to bloom. I planted a bed of 75 of the large bulbs, and nearly the whole of them have failed to produce roots and, of course, blooms. The small bulb is one of a number which also utterly failed. HENRY R. INMAN.

[It is difficult to account for the failure of the Hyacinth bulbs to make roots. We have examined the specimens and cannot find a trace of fungus likely to be the cause of the trouble. One of two causes may be at the base of the trouble. Some soil insect, such as cutworms or leather jackets, may have eaten the roots as they were produced, or some cultural error may be operating. If soil insect attack is responsible a good soil insecticide would probably help you, but it

Choice Trees and Shrubs in the Exeter Nurseries

WITH two hours to wait in Exeter how could time be better employed than in visiting the old-established nurseries of Robert Veitch and Son, Ltd.? The nurseries are situated within a few minutes' walk of the heart of the city of Exeter.

On entering the nursery gates large Magnolias were seen in flower on both sides of the main walk. These nurseries have long been noted for their Magnolias, and we shall always remember the pride with which the late Mr. Peter Veitch used to bring up cut blooms of Magnolias to the meetings of the Royal Horticultural Society. The Magnolias flowering so freely in the main walk were M. speciosa (white), Soulangeana (pink and purple veined), alba superba, salicifolia (white), and Lennei (rosy-purple). In a sheltered corner of this nursery stands a fine old tree of the early pink-flowering M. Campbelli. It is interesting to record that the Magnolia Veitchii which gained the F.C.C. R.H.S. in 1921 was raised in these nurseries. The flowers of the hybrid are of a lovely blush-pink and are produced with greater freedom than on Magnolia Campbelli, one of its parents. The collection of Magnolias at Exeter and at the branch nursery at Exminster is unique, no less than 35 species and varieties are grown, all of which are described in the useful catalogue of trees and shrubs issued by this firm.

The illustrations on the page opposite show some of the Magnolias in bloom and other interesting shrubs, as Viburnum Bitchinense, Osmanthus Delavayi, and Pieris (Andromeda) Taiwanensis, the latter growing in quantity in nursery rows with other peat-loving or lime-hating plants, as Clethras Vacciniums, Kalmias, and Gaultherias.

It was a busy time in the nursery. Rhododendrons were being grouped and packed for the Rhododendron Show, while other plants were returning from the Truro Spring Show, and Miss Veitch, who has charge of the nursery since her father's death, was supervising the work.

On entering the greenhouses we were greeted by many pleasant surprises. Here were to be seen a large batch of four or five year old seedlings of that rare and difficult plant, Telopea truncata. In another house was a large batch (imported) of Daphne Genkwa and groups of Illicium anisatum, Pentapterygium serpens, Lagerstrœmia indica, Diosmas, Theas or Tea plants, Grevillea puniceus in flower, and the hardier and very beautiful Grevillea oleoides. Dendromecon rigidum was flowering well in company with Eugenias, Pomaderris elliptica, P. phylicifolia, Olearia semi-dentata, and O. insignis. In another house we saw a group of that old-world plant, Geranium tricolor, with flowers red, black, and white in well-defined colours.

One house was full of Kurume and other Japanese Azaleas in full bloom. Here were seen the brilliant Hexe, Mikado, rosea, Hinodegiri, Hinomayo, japonica, Yodogawa (double, lavender), but the best of the bunch was Koran, with Hose-in-hose flowers of clear scarlet-pink.

One greenhouse wall was literally white with the fragrant flowers of Rhododendron Gibsoni, a tender Rhododendron that reminded us of the variety Lady Alice Fitzwilliam.

In these brief notes we have mentioned only a very few of the good plants that caught the eye on the occasion of a recent
pleasant visit to these renowned and int
ing nurseries. H.

Some homely flowers and their

THE EXETER NURSERIES OF ROBERT VEITCH & SON, Ltd.

1. The large shrub (nearest camera) is Viburnum Bitchinense. The flower heads are smaller but it is more free flowering than V. Carlesii, to which it is closely allied and with which it is often confused.

2. The main walk in the Exeter nurseries.

3. Magnolia Soulangeana in the main walk.

4. Andromeda (Pieris) Taiwanensis well flowered in nursery rows.

5. The large shrub with white flowers on the rock bank is Osmanthus Delavayi.

ANSWERS TO QUERIES

(Continued from page 346)

would be more satisfactory if you could ascertain actually what insect did the damage. We have known the grub of Clay-coloured Weevil cause similar damage. The cultural error question is even more difficult because we do not know local conditions. Were the bulbs planted early enough? We think that if the bulbs were allowed to complete their growth and then were lifted and replanted in an odd corner of the garden they should in time recover, but you will appreciate that the bulbs will be considerably weakened.]

Birds destroying Polyanthus blooms

(F. M. W.).—Mice are not responsible for the damage to your Polyanthus. These are picked off by sparrows and other birds in search of something which they find at the base of each flower. In this practice they have been unusually annoying this year. A few strands of black cotton stretched over the plants would check them.

Cheiranthus Newark Park

Re correspondence (page 323) to Mr. R. Pearce. A year or two ago I obtained the above from Messrs. Bowell and Skarratt, Cemetery Road, Cheltenham, but cannot say if they still have it. I consider it identical with C. Allioni Miss King's Variety, obtained from Carter Page and Co., London Wall, E.C. Isaac Carr.

Poolemeade, Bath.

Lifting Anemones

I suppose Anemones Fulgens, Blanda, and Apennina can, without injury, be lifted when flowering is finished, dried, and put away before replanting in the autumn? Should they be dried in the sun? W. P. P.

[You cannot lift and dry off these Anemones while in growth, but must wait until the resting season. You can, however, lift and replant at once, immediately after flowering is over, if you carefully shade from the sun until the roots are again active.]

GREENHOUSE

Diseased Arum Lily

(E. J. E.).—Your Arum Lilies are affected with Soft Rot, which is caused by the bacterium Bacillus carotovorus. This disease usually shows itself about January. The first sign of attack is the withering of the leaf apex and a drying up of the entire margin. The diseased leaves die off early. If the roots are examined they are found to be more or less rotted, and the disease often spreads into the corms. Sometimes later in the season the foliage appears to recover, but it soon reverts to the diseased condition. The recovery is due to the production of new roots. After a time the new roots become infected and the leaves go under. When your plants have been dried off they should be shaken out of the pots and all soil removed. All the roots should be scraped off and decayed parts of the corm cut away. The corms should be well scrubbed with water and a hard brush. The corms are then steeped in a 2 per cent. solution of formalin for four hours. Care must be taken that the foliage, if any, be kept out of the formalin solution. After treatment the corm should be immediately potted in disease-free soil and sterilised pots. All soil in which the diseased plants are growing, together with the diseased portion scraped and cut away, should be burned and the pots sterilised because this disease attacks many other plants.

Carnations in cold house

(" Pat ").—It is seldom that the Malmaison Carnation is much good after about the second year. You should, therefore, have your plants layered, and grow on young, sturdy plants, these almost invariably flowering well. We do not quite know what is meant by " French " Carnations. Do you mean " tree " or " perpetual "? If so, these do not succeed very well in an ordinary mixed greenhouse. They are best when frequently propagated. It is past the time for taking the cuttings, November to January being the proper season. After these cuttings are rooted and are growing freely they should be placed in cold frames until October. Full details of culture would occupy too much space in this column, but there are frequently seasonable notes on this subject in our pages, which please see.

ALPINES

Rabbit-proof Alpine plants

(" Kincardine ").—There are very few plants that rabbits will not attack under certain conditions. We have known them devour Leeks, at times, although these are usually immune from attack. We do not remember ever having seen or heard of them touching the Mossy Saxifrages, Sedums, Perennial Candytuft, Dryas octopetala, Daffodils, Veronica juniperoides, St. John's Wort, Rhododendrons, Snowdrops, Wood Hyacinths, Anemone nemorosa, Aubrietia, Arabis, Geranium Lancastriense, Box, and Heuchera brizoides, but cannot guarantee even these to be always safe. Have you no way in which you could protect your plants by means of wire-netting?

TREES AND SHRUBS

Lonicera nitida, and propagating Forsythia suspensa and Border Carnations

(Mrs. Thrush).—There is no record of Lonicera nitida having caused injury to any living thing, and we do not think you need have cause for anxiety regarding either poultry or cattle feeding near it. As you are probably aware, it is only during recent years that this accommodating shrub has been used for hedging, but no complaint has so far been received regarding it. Forsythia suspensa is easily propagated by means of cuttings made of half-ripened shoots, which may be inserted in sandy soil and kept in a cool, closed frame at the end of August. The branches will also root freely if pegged firmly to the ground, slightly barked on the lower side, and covered with sandy soil. Carnations.—All the Border kinds should be layered early in August, and, if properly done, should be ready for transplanting early in October. Soil containing a percentage of sharp sand should be used for layering.

Shrub for name

(N. D. P., Perthshire).—Your shrub is Cydonia japonica. This Quince was introduced from China in 1796, and now there are many varieties of it grown in gardens. The type plant is the one you send, and this will make a large bush when grown in the open, but it is more often trained to a wall. It fruits freely in some districts. Little pruning is required, but if the plants are unshapely they may be safely cut back directly flowering is over. Most of the Quinces root fairly well from hard-wooded cuttings.

MISCELLANEOUS

Grubs for identification

(E. F. P., Penrith).—These are destructive pests known as leather jackets. This grub, which has no legs, becomes the Crane Fly or Daddy Long Legs. In some districts it is as great a pest as the wireworm is in others. It is particularly destructive to young plants of the Cabbage family and Lettuce, and to
Carnations and other bedding plants,
in herbaceous borders, etc. In addition,
quently causes injury to the grass of l
where large patches may often be
scratched about by birds in their effor
capture these grubs. It is particularly
sary to keep down weeds in the ga
especially grass weeds, as the eggs are
on these in the autumn. The best mea
exterminating leather jackets and wire
is frequent working of the ground.
may also be trapped by putting in th
pieces of Carrot or Potato, which shou
examined daily. Constant hoeing re
the numbers of these pests.

THE BOOK OF THE TULIP

By SIR A. DANIEL HALL

K.C.B., LL.D., Sc.D., F.R.S.

Director of the John Innes Horticultural Institution

24 full-page plates (12 in colour)

FIRST REVIEWS

The Times.

"Of special value to all growers, whether elementary or ambitious. It treats of the history of the bulb, from the early days; describes the wild species, chiefly found in Central Asia, and the several classes—Dutch, Old English, Cottage, Parrot, Darwin—into which their countless descendants are divided. There are full directions for growing, hints on hybridising and seed-raising, practical notes on diseases of the family and scientific ones on its physiology. An admirable handbook for all admirers of the splendid flower. There are many plates, in black and white and in colour, of typical blooms of the various classes."

Times Literary Supplement.

"Sir A. D. Hall's book comes at a fortunate moment for all who have been taken, lightly or seriously, with the restored vogue of the tulip. In moderate compass and with easy authority it goes fully into the history, science and æsthetics of tulip-growing."

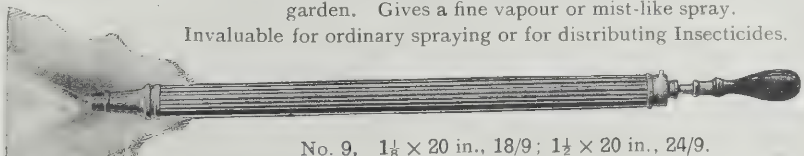
The "Four Oaks" Gold Medal Syringes

The greatest boon to the gardener ever invented. Acknowledged by all users the best syringes the world has ever seen. No gardener who has once seen these syringes will ever buy any other.

The "Four Oaks" Undentable Spraying Syringe. The most useful syringe it is possible to have in a garden. Gives a fine vapour or mist-like spray. Invaluable for ordinary spraying or for distributing Insecticides.



No. 9, $1\frac{1}{8} \times 20$ in., 18/9; $1\frac{1}{2} \times 20$ in., 24/9.
Is fitted with quick filling ball valve.
The $1\frac{1}{8} \times 20$ in. size strongly recommended.
Angle bends for spraying undersides of leaves and branches. $1\frac{1}{8}$ in., 2/3; $1\frac{1}{2}$ in., 2/9 extra.

We also supply **plain** barrel spraying syringes as above, but not undentable.

No.		14×1 in.	20×1 in.	$20 \times 1\frac{1}{4}$ in.	$20 \times 1\frac{1}{2}$ in.

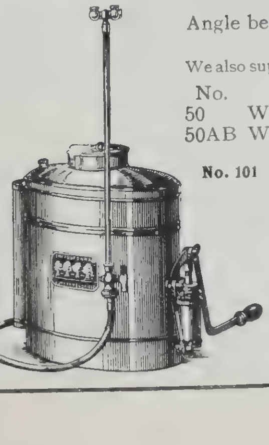
50AB	With angle bend	15/-	18/-	24/-	29/-



"Four Oaks" Gold Medal Knapsack Sprayer, External Type.

Brass Ball Valves, Brass Pump, all working parts outside Container.

Price **£4 10 0**. If Tinned Copper, for use with Lime, Sulphur or Liver of Sulphur, 7/6 extra.

REMINDERS FOR THE WEEK

Southern and Midland

Bedding plants

The majority of these may now be stood in the open to become thoroughly hardened, as there is little likelihood of any damaging frosts occurring after this date. Shelter from rough winds is, however, advisable until the plants have been exposed for some little time. Standard Heliotropes, Fuchsias, Plumbagos, Pelargoniums, and similar plants must be included in the above or they will suffer when planted out in the beds. As a precaution against hailstones damaging their leaves it is advisable to leave Begonias in cold frames with the lights off, but ready to be pushed over the plants in case of need. Some provision of the kind should be at hand in case of need for all large-leaved plants which otherwise might become seriously damaged.

Cold frames

Few keep their old Cyclamen plants from year to year, but, providing they are clean and healthy, it is a good plan to do so, as more flowers are produced from a single plant than from those of one year's growth. The cold frame is the place for these at the present time, and no better accommodation could be given to the young growing plants. The old plants should be permitted to gradually ripen their leaves so that the tubers may be repotted into fresh loam in a few weeks' time, but the young plants must be encouraged to grow freely by closing the frames at night and by dewing them overhead twice daily during hot weather.

Primulas

Both sinensis, stellata, obconica and its beautiful hybrids, also many other plants which are being grown on for next winter's blooming, will be found to be perfectly happy when growing in cold frames, and less subject to insect pests than when grown on hot, dry shelves in greenhouses. In order to provide a quantity of small plants which are to bloom in small pots successional sowings may still be made.

Begonia Gloire de Lorraine

This and the many beautiful fibrous-rooted varieties now available for winter flowering should be grown on in moist heat with a night temperature of 65 degs. If the house in which these are growing is shaded lightly during the day, very little air will be advisable at this stage of their growth. Pot on the plants in good time into a mixture of best maiden loam two parts, leaf-mould and rubbed peat one part, with the remainder made up of a little old lime-rubble, wood-ash, bone-meal, and sand.

Propagating spring-blooming plants

Cuttings must now be inserted of Arabis, Aubrietias, Alyssums, and other plants used for spring bedding. These should be about 3 inches in length and will strike most freely when dibbled firmly into boxes or borders of sandy soil, over which airtight frames can be placed. For those who do not possess frames for this purpose I advise the following method, which has served me well on many an occasion. As the plants are taken from the beds they should be laid in, in lines, across a spare piece of ground made firm and kept watered until growth is again active. About the second week in August each plant should be spread out in a circle. A good layer of sandy soil is then placed over the growths at 3 inches from their tips. The soil must be kept moist and, by the time they are required, good, strong-rooted plants will be available for any purpose.

Roses and Honeysuckle

These, which are addicted to Green Fly attacks, especially when growing on walls, must be watched and sprayed with an insecticide, such as Abol or Quassia and nicotine, immediately this pest is discovered, or the plants will not only be disfigured, but the flowers spoilt. The same applies to Roses in beds, which will also be improved by a constant stirring of the surface soil, even though a carpeting plant is employed.

Strawberries

Apply a light dressing of Peruvian guano to the beds before working the surface for the last time. The lines should then be mulched with clean straw to protect the oncoming fruits, and should the weather prove hot and dry generous watering must be indulged in. Dip in insecticide those plants which have been forced, and after reducing the balls of earth somewhat with a pointed stick, plant firmly on well-prepared ground, care being taken to prevent dryness at the root.

Peas, Kidney Beans, Spinach, and Salad plants

These may now be sown generously in order that abundant supplies will be forthcoming during the next few months.

Early sown crops

Onions, Parsnips, Carrots, etc., should be thinned out before the plants get too large, and where Onion and Carrot Fly is troublesome care should be taken to press the earth about the roots of the remaining plants in addition to running the hoe through the soil. A wineglassful of paraffin to 2 gallons of water poured over the rows will prove offensive to this fly. E. MARKHAM.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Potatoes

No other vegetable is so grateful for a constant stirring of the soil, so it is well to frequently ply hoe, digging-fork, or Bucco cultivator between the rows from the moment growth shows through the surface until it is time to earth the crop up. Besides greatly benefiting the Potatoes it also keeps down weeds and makes the earthing-up very easy.

The Asparagus beds

Another fair dressing of salt should now be given, which, besides benefiting the crop, assists in checking the growth of weeds. If available, an occasional soaking of liquid-manure proves very stimulating to this plant.

The Dutch hoe

This is the most valuable tool in the garden during the spring, summer, and autumn, and every available minute should be spent plying it vigorously between rows of vegetables and among plantations of Roses, herbaceous plants, fruit bushes, etc. Do not, of course, use this tool when the soil is sodden and sticky.

Raspberries

On dry, light soils this fruit is apt to suffer somewhat from dryness at the roots, so under such conditions a generous mulch of well-rotted manure, or even half-rotted leaves, will do a world of good, conserving the moisture in the ground by preventing undue evaporation, and also keeping the soil at the roots cool. Pull up all unwanted canes as they appear, and prevent weeds getting a foothold.

Strawberries

These will shortly be sending up flower-stems, so it is desirable to hav beds thoroughly weeded and the soil hoed. If a mulch of clean wheat stra then given, it is much easier to apply the berries set and bend down the stem also acts as partial protection against

Recently-planted Strawberries

It is unwise to permit beds plantec spring to carry fruit, for if they do plants are weakened and can never quently produce fine fruits. Remove, fore, all flower-stems as they appear also all runners unless it is desired to fresh plants from these in autumn. hoe the ground frequently and give an sional soaking of water should the we be dry.

Peaches on walls

These very soon begin to suffer from ness at the roots when planted, as they to be, against sunny walls. A thorough ing of water should, therefore, be unless the weather be very wet. If a ous mulch of manure be spread all ov roots shortly after a soaking of water benefit will result. Continue to disb intervals.

Bedding out

This is now a more leisurely business it was in the past, so many harc nearly hardy plants being used formerly only tender subjects were all By now quite a number of the hardier are already in their flowering quarters, the end of the month there will only r the really tender kinds to handle.

Pentstemons

If not already planted out, these stately, autumn-flowering plants shoul mediately be tackled. A fairly rich, tilled soil and a sunny position, she somewhat from rough winds, shou possible, be given them.

East Lothian Stocks

These, if not yet planted out, should immediate attention, as quite a long of growth is required to build up fine, s ing specimens.

Pricking off Primulas

The seedlings of P. obconica ar sinensis should, when fit to handl pricked off into boxes of light, rich while the earlier batches should be pla 3-inch pots, using a sweet, wholesome post and returning to the same tempe until well established, when they shou moved to shady, cold frames.

Tuberous-rooted Begonias

The late-started plants should no ready for their flowering-pots. A sound compost should be given, but great deal of sand. Seedlings of this should now be fit for 3-inch pots. Pot and place in a nice, genial atmos shading well from all sunshine.

Nerines

In most cases these have now com their growth, so water should be gra withheld. As soon as the foliage ch colour withhold water entirely and s pots on a sunny shelf for the summe a drop of water being given until the f stems begin to rise in autumn. C. BL

FOSTER & PEARSON, LTD.
who for Eighty Years have upheld their reputation for sound work.

Lawns
raded Correctives

To obtain a perfect lawn, free from weeds, clover, etc., you must use our Graded Lawn Correctives. The mixtures are the result of extensive research and trials, and are graded according to the soil on which they are to be used. Send us a trial order together with a specimen of your lawn (2 × 2) and on the report of our Chemists a Corrective specially adapted to your soil will be forwarded.

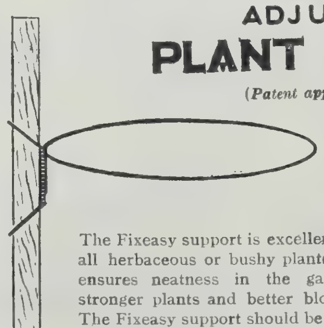
The FIXEASY
ADJUSTABLE
PLANT SUPPORT
(*Patent applied for No.* 25278/27)



AS SHOWN AT CHELSEA

The Fixeasy support is excellent for all herbaceous or bushy plants. It ensures neatness in the garden, stronger plants and better blooms. The Fixeasy support should be fixed before plants are sufficiently grown to be beaten down by rain and wind—therefore, now is the time to buy.

No. 1—Single 9, 11, 13 or 15 inch ring, without stake, **6d.** each.
No. 2—Double 18, 22, 26 or 30 inch ring, without stake, **1/-** each.
No. 3—Junior 5, 7 or 9 inch ring, with ½ inch stick, **6d.** each.
5 ft. stake, pointed, stained and creosoted foot, **3d.** each.

"Yielded more Strawberries"

"FRUIT CLEANER"
"LARGER FRUIT"

"Best Crop in 10 years after using Magna Strawmats," writes another grower from Teignmouth. From all parts of the country enthusiastic reports from actual growers continue to reach the makers. Excellent results have been obtained wherever these Magna Strawmats have been used—the improvement in yield, flavour, and size from use of such a simple device is remarkable.

Now is the Time to put Strawmats down

The Utmost advantage can only be obtained if "Strawmats" are put down now. Simply push the plant through the hole in the Strawmat, which then protects the plant against dirt and parasites and encourages rapid growth. The mats are quickly put down, are tidy and neat when down, and render rapid picking very much easier and simpler. Over half-a-million have been sold to date.
Secure MAGNA protection for your Strawberries and look forward with confidence to a good healthy **early** crop this year. Write to-day for TRIAL BALE (1 gross Carriage Paid) to Patentees.

e Charm of an Old World Garden

castery Garden

Our "Chelsea" Exhibit, 1928

There is no charm like that of the old world garden, and it is among life's rare pleasures to discover ourselves in one at the end of a long day of dust and travel. All feel its peace and restorative influences, and every garden lover will journey far to see the old world garden at its best.

It cannot be brought to your door, but in all its essentials of design and tree and plant life it can be reproduced for you by specialists who have made it their particular contribution to garden craftsmanship. Baggesen's, whose old Monastery garden was an outstanding feature of last Chelsea Show, will be delighted to discuss such a scheme with you.

LANDSCAPE GARDENING

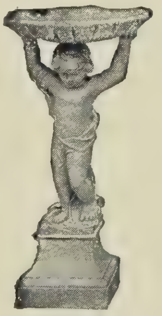
omplete your Garden Plan with a beautiful "LEFCO" arden Ornament——

Nw that blooms begin to appear in your gden, you can look around and judge h result of your months of labour and pnning. "Splendid," you will sa, except that corner where a "efco" Ornament would look sc well. "Lefco" Garden Oaments are designed to help h gardener make more perfect iiplanning. They are designed toorm centres of interest, which wl turn neglected corners into nks of delight. They are deigned to give that "finish" toour garden which you know scwell it needs.



Bird Bath No. 25
Price **105/-**

Among the range of over fifty models, you will find one just suited to your garden. There are vases for the steps, sundials for the lawn and paths, animal figures for the rockeries. The "Lefco" Book of Garden Ornaments illustrates them all, and shows you how to place them in your type of garden. Ask to-day for this helpful Catalogue. It will be sent post free if you fill in the coupon request.

"Lefco" Ware is being displayed at the Chelsea Show by Messrs. Robert Green, Ltd.

Height, 36 ins. Width of Bowl, 18 ins.
Width at Base, 12½ ins.
Price, complete, **65/-** Vase only, **30/-**

pecial Sample ffer **"Lefco" Miniature Figures**

No. 1. THE FROG

PRICE, Post Free, 2/6

This quaint "Lefco" piece stands 3 ins. high. In addition to its use in the garden, it forms a really admirable paper weight or mantel ornament. Made of the famous "Lefco" Ware, it will not crack, a wipe with a damp cloth will remove any dirt. Charming, useful, and very low in price. Obtainable only from the makers.

See the label on every piece of "Lefco" Ware. It assures you that it is genuine and British made.

"Blue for Beauty"!

THAT'S WHY NO GARDEN IS COMPLETE WITHOUT

delphiniums!

BLUE EYES, blue skies, blue seas . . . and the glorious Delphinium excelling them all! Hewitt's famous Warwickshire Nurseries send the finest thoroughbred Delphiniums to add their graceful beauty to gardens the world over.

Not without reason have these wondrous plants earned so many Gold Medals.

Truly they are veritable Rhapsodies in Blue.

A GARDEN has failed to attain its highest degree of loveliness without Hewitt's worth while Delphiniums. Though their slender, tapering spires suggest delicacy in their very charm, Delphiniums are quite easy to cultivate. Send NOW for Hewitt's big Delphinium Catalogue, giving particulars of the finest selection available in this or any other country. Prices are most moderate, having regard to the supreme quality of the plants.

via Bromley—Sevenoaks, through the Garden of England to Tunbridge Wells. During the month of June the slopes of "The Old Gardens" are alight with the spears and shafts of countless Irises. Rhododendrons too, in all the bravery of their massed flowers, make a gorgeous display. A visit to our beautiful Nurseries brings its own reward to all those who love flowers and who take a keen interest in gardens.

Besides IRISES and RHODODENDRONS "The Old Gardens" are famous for LILIES, JAPANESE MAPLES, CONIFERS, HARDY SHRUBS and TREES, HERBACEOUS and ALPINE PLANTS, and all HARDY BULBS. Our up-to-date collection includes many rare subjects and at all seasons of the year our Nurseries are full of interest and well worth a visit of inspection.

It is worthy of note that at the recent Rhododendron Show at the R.H.S. Hall on April 30th we were awarded the Silver Challenge Cup for the finest exhibit of Rhododendrons. This stands for fine quality and a high standard of cultivation.

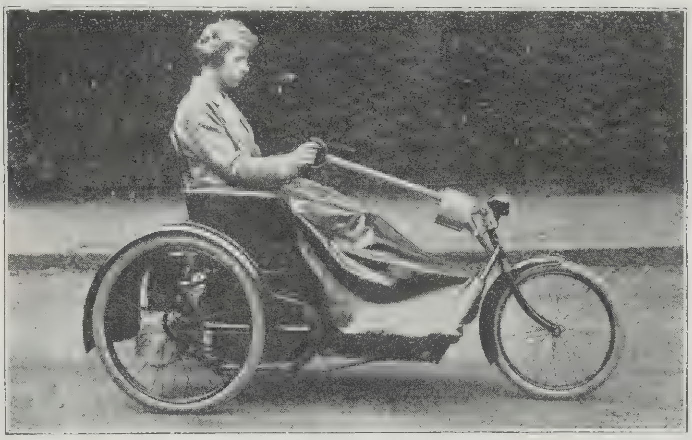
Enjoy your Garden or Park to the full in Comfort



ARGSON ELECTRICALLY PROPELLED TRICYCLE.

IN Tricycle construction the ARGSON Electrically propelled Tricycle is ideal. The seat is well sprung, is luxuriously upholstered in leathercloth and very roomy. Combined with a spring cushion you get arm-chair comfort.

A silent and smooth running mechanically propelled vehicle which can be relied upon to negotiate whatever gradient may be encountered, and to function with a clock-like regularity. Carrying an 85 ampere hour capacity, 24 volts storage battery, the "Argson" has a radius of 30 to 35 miles per charge.

It is so simple to operate, that even a child can drive it. The steering, speed and brake controls are combined in the tiller with stirrup handle, and the user can go at graduated speeds from one to nine miles per hour at will.

Suitable for either Town or Country.

Price **£95 : 10 : 0** ex Works.

Your Garden Needs the added charm of a "LEFCO" Garden Ornament

SPADE WORK is after all only spade work. It can produce bloom in profusion, but after months of planning you want something better than the average garden—a "Lefco" garden ornament, rightly placed, will give that "finish."

"Lefco" Garden Ornaments are modelled in speckled coloured "Lefco" Ware, their design and colouring harmonise completely with the charm of your garden. For every part of the garden there is a suitable piece of "Lefco" Ware: Vases, Figures, Sundials, Bird-Baths and Quaint Animals. The "Lefco" Book of Garden Ornaments shows you how they should be placed. It is a mine of interesting suggestions which every garden lover should have. There is a copy for you if you ask for it to-day, sent free and post free if you fill in the coupon request.

The latest addition to the range of "LEFCO" Garden Ornaments

This delightful model has been specially designed at the urgent request of many hundreds of "Lefco" owners. It is particularly suitable for small gardens.

Lovers of birds in the garden can now secure this charming piece at the special introductory price of **50/-**.

"LEFCO" Miniature Figures

No. 1, THE FROG

PRICE Post Free 2/6

This quaint "Lefco" piece stands 3 ins. high. In addition to its use in the garden, it forms a really admirable paper weight, or mantel ornament. Made of the famous "Lefco" Ware it will not crack, a wipe with a damp cloth will remove any dirt. Charming, useful, and very low in price. Obtainable only from the makers. See the label on every piece of "Lefco" Ware. It assures you that it is genuine and British made.

Grower gives his Secret to the World of Gardeners

"KULBAK"

(Registered Trade Mark)

ULBAK" MANURE is the esult of over fifty years exerimenting and testing by a cientific and practical grower nd its action is quicker and more certain than that of ny other manure on the narket.

ULBAK" MANURE is not a Fertilizer but a Plant Food omplete in itself and re-uires the addition of no other nanure whatsoever.

ULBAK" MANURE does not orce growth but compels per-ect and healthy development vhich ensures successful re-istance to all pests.

TESTIMONIALS.

I have been greatly troubled with Slugs, and Insect Pests, but to my great surprise I did not lose a single plant this Year. This I attribute to "*Kulbak*" Manure. Everything I grew gave greatly increased Crops and this was particularly marked in the case of Tomatoes.

We specialise in Carnations and before we used "*Kulbak*" Manure we were manuring our beds every fourteen days using a well-known Brand. Now we only use "*Kulbak*" Manure about every four months, and we get better Blooms, Longer Stems and Healthier Plants which are practically Pest Resisting.

Before using "*Kulbak*" Manure I was badly troubled with Garden Pests, but since I have treated my soil with it not only have I had Finer and more Healthy Blooms, but almost a total lack of insects of any description. This I can honestly attribute to your preparation.

Originals can be seen any time at the Head Office.

AN UNIQUE MANURE
and complete food for all Plant and Vegetable life

"*KULBAK" MANURE* purifies and enriches the soil and acts exactly the same on every form of plant life and on every kind of soil.

"*KULBAK" MANURE* contains no soluble acid of any kind.

"*KULBAK" MANURE has no smell, it is clean to handle,* simple to use, and is equally effective in both indoor and outdoor cultivation.

The use of "KULBAK" MANURE guarantees

Perfect Flowers Healthy Vegetables
Luscious Fruit Lawns like Velvet

Fruit Blossom in the Garden

TER the enjoyment of several weeks of fruit blossom it is good to look back ar take stock of the trees which have r garden a fairyland of beauty. In q nce of the late season Apple blossom ll with us, and, indeed, at its best in M, while such late-flowering varieties yl Jubilee and Crawley Beauty will be n loom in June.

ely districts during a green winter ses occasionally certain varieties of s and Pears opening at the end of uary, but March, of course, is the al time for these to r, he several varieties of h arry on until April, Cherries follow in n and at the same time ar Pears. The sweet or rt Cherries blossom first, we at a later period by o or kitchen varieties Mello. May completes hi month of the fruit- r season, which, in a stoked garden of fruit the most beautiful o the year.

is oubtful if many people apreciate how beautiful rd freely planted with ees may be, and no rig shrub excels them in repect (excepting, per- yrus Aldenhamensis); d, very few produce that h f flower which a fruit a ies.

study our favourite rs our Roses, Carna- d know their points, mst varieties of fruits teir individuality and acrs which become the iteresting as we learn them better.

ui trees are usually planted for the sake he fruits. One naturally studies this ist, taking the beauty of their blossom a matter of course. Not so the bees, eve, and on a warm spring day the hum er adds charm to the scene.

akig them in the order of flowering, the ns which produce most blossom are rieties which also fruit more freely, r, Victoria, Pershore, Early Gis- , he Gages being rather less free- rig.

te Pears are beautiful, indeed, especially our favourite Louise Bonne of Jersey and Williams' Bon Chrêtien, but perhaps the most conspicuous of all is the blossom of Jargonelle, its large, bell-like flowers being unexcelled.

Of the Cherries there is little to choose between the dessert varieties, and some people also like the beautiful double-flowering sorts, the double French (white), Jas. H. Veitch and Hisakura (the two best pinks), but I want nothing more lovely than the late-flowering Morello.

The Apples are worth studying more than all. They have more individuality, last longer, and, flowering in the full heyday of spring, have a joy about them which is infectious.

A Cherry orchard in full bloom near Horsmonden, Kent

From a photograph taken on May 16th

We commence with the subdued blush-white Red Astrachan, the saucy rosy-pink Irish Peach; and then carry on with a plethora of laughing blossoms, such as the red-tipped buds of Lord Derby and Lane's Prince Albert (which never fails to produce garlands of flower), of the more sedate and formal Golden Spire, which, lasting for a considerable period until very late in the season, always sets its flowers in fruit.

If one likes a Peach-blossom pink the flowers of Brownlees Russet, Lord Suffield, and Darcy Spice are very bright, while among the almost white are Sops in Wine, Worcester Pearmain, and Red Juneating, all producing red-coloured fruit.

Of the finest of all Apples, Cox's Orange Pippin, one can only say that it blooms profusely in the same way as Jas. Grieve, and Mr. Gladstone, Bismarck, and Annie Elizabeth are flowers above the average in size.

Charles Ross carries us on until we come to Royal Jubilee and Crawley Beauty among the last of a great many of our spring flowers, thus carrying on the herald voices of spring until summer takes up the chorus in June.

There are over 200 varieties of Apples in cultivation, many with their own individuality, which make an interesting study, and England, where the Apple is so much at home, is one of the most beautiful lands of the earth when the Apple is freely planted.

LAURENCE J. COOK.

The Iris Society's Show and Programme

It is anticipated that the forthcoming Show will be the best in the annals of the Iris Society. Further interest to the Show is added by the deputations and exhibits from Iris growers on the Continent and in America. The show will be held in the Royal Horticultural Society's new hall, on Thursday and Friday, June 6th and 7th. This is the first occasion on which the Iris Society has attempted a two days' show, and every effort is being made to make it a success. The show will be opened at 12.30 p.m. on the first day by His Excellency the French Ambassador, and at 4.30 p.m., on the same day, the Iris Society, the Royal Horticultural Society, and the English Speaking Union will entertain members of the Garden Clubs of America to tea. At 11.30 a.m. on the second day, June 7th, there will be a discussion on "Garden Irises," to be opened by Mr. R.

W. Wallace, and at 3 p.m. Mr. P. R. Barr will deliver a lecture on "Iris Species for the Garden." Among the most important medals and trophies offered at this show are the Dykes Memorial Medal, to the best new seedling Iris; the Silver Medal of the American Iris Society, for the best twelve spikes of Bearded Irises of American origin or raising; the Iris Society's Challenge Cup (presented by Mrs. Philip Runciman), for the best exhibit of Irises staged by an amateur; the Gordon-Lennox Challenge Cup (presented by Lady Algernon Gordon-Lennox), for the best exhibit demonstrating the decorative value of Irises, on a space not exceeding 75 square feet (open to all); and the Christie-Miller Challenge Cup (presented by Mr. C. W. Christie-Miller), for the best collection of Iris species, arranged in a space not exceeding 30 square feet. The schedule may be obtained from the Hon. Secretary of the Society, Mr. G. L. Pilkington, Lower Lee, Woolton, Liverpool. Entry forms must be received not later than May 28th.

Tunbridge Wells Show

The Royal Tunbridge Wells Horticultural Society are holding their show on July 9th and 10th in the Calverley Grounds, which are opposite the Central Railway Station. Tunbridge Wells is a great centre for gardening, and the prize list, which is a particularly attractive one, is sure to secure good entries. There are both open trade displays and open classes, with the offer of several Challenge Cups in each of these sections. Ladies have opportunities of winning first class awards in the Table Decorations division. Mr. A. Heathfield, 42, Tunnel Road, Tunbridge Wells, is secretary of the society.

Gardens open to the public

By the courtesy of the owners, the following gardens will be open to the public during the coming week for the benefit of the Queen's Institute and District Nursing throughout England and Wales. A charge of 1s. is made for admission :—

SATURDAY, MAY 25th.

The African Blue Lily

One of the best-natured plants that can be grown in tubs for summer porch and terrace decoration is Agapanthus africanus (umbellatus), or African Blue Lily. The generic name, Agapanthus, is derived from the Greek and means "love flower." In June large umbels of clear blue flowers, resembling in form those of Clivia, are borne on stalks 2 feet or 3 feet high. When the plants are grown in conservatories or window gardens the foliage is evergreen and flowers appear in early spring, but the common practice is to rest the tubbed specimens over winter in a light, cool cellar where only enough water should be provided to keep the roots plump until spring, when growth may be started again. If the plants are crowded, they may be divided in spring and reset, preferably in tubs of sandy soil, as the heavy roots may burst clay pots. Dividing is made easier by first soaking the roots in water for a few hours. Heavy watering will be necessary during the blooming period. In addition to the type there is a white variety called albidus and one of dwarf habit and blue flowers named Mooreanus.

Agapanthus umbellatus (the African Blue Lily) in the grounds at Albury Park, near Guildford

Tulips producing many flowers o stem

I was interested to see in issue Ma page 322, that someone had been writ you about Tulips having several hea one stem. I had been thinking of w to you myself to ask if it was usual, as a large proportion of my Tulips have the same this year.

The main blooms have been speciall and now that they are going over th ones are coming on, which will prolo display for some time. They are cha little miniature flowers, hardly half th of the main blooms, but delightful for ing; and far from getting rid of my I shall do my best to encourage th supply a succession of blooms!

They are the real old-fashioned kind fragrant, which had been undisturbe generations, and we dug them all up a planted them about 2 years ago, whi certainly agreed with them.

L. E. Crof

Toberfechin Ballisodare,
Co. Sligo, Ireland.

——Having seen E. P. Silchester's *re* Tulips with as many as five buds, I like to say we have four beds of La Noire, and I find there are quite 35 pe of two, three, and four blooms on each this has not occurred in any other vari are growing. I have noticed a few i particular variety in other years.

Sussex. Holmestro

Effects of winter in North De

As far as can be seen, the effects most severe winter we have had sinc have, on balance, been good rather th in the garden. Of things killed outr can only find two or three of the br soft-leaved Veronicas and possibly on large old bush of yellow Calceolaria, may still sprout from the stump.

Of things killed at top and for som down, I note Ampelopsis sempervire some of the outdoor Fuchsias. So f shrubs, but of plants the Mesembry mums appear completely killed, and tions look very poor.

On the other hand, Roses, Flag Iri a host of plants that find our winte mild and damp are looking far bette usual.

Daffodils began the season very lat by early April had caught up to an a season, their stems (especially of the sorts) were rather short, but blooms good. Auriculas are now very goo

Tales of the great frost

o have read with interest the recent rts of others *re* the "great frost." I venture to send my observations here. This garden is very exposed—absolutely no shelter and within a few hundred yards of the Channel.

The only plants I have actually lost are:—Acacia Hanburyana, Leptospermums Boscaweni and multipetalus fl.-pl., many Mesembryanthemums, and Agathæa celeste.

Those cut severely but which are now breaking freely after cutting back are:—Acacia dealbata (30 feet), Calceolarias integrifolia and violacea, Fuchsias (many varieties), Ficus repens, Adiantum cap. ven., Solanum jasminoides, Metrosideros (perfect specimens, 3 feet to 6 feet), Ceratostigma Willmottiæ (5 feet bushes), Aloysia, Cassia corymbosa, Erica melanthera, Hypericum Œgypticum, Crinodendron Hookeri (perfect specimens, 8 feet through), Embothrium coccineum, Senecio rotundifolium, Clianthus puniceus and alba, Diplacus coccinea, Genista fragrans (perfect specimens, 10 feet through), Oleanders, Libonia floribunda, Eucalyptus globulus (70 feet high, stripped of leaves).

Others which have come through the ordeal very well are:—Mitraria coccinea, Damnacanthus, Sedum Barbatum, Punica granata, Acacia armata, Benthamia, Abutilons vitifolium and vexillarium, Carpentaria, Jasminum primulinum, Habrothamnus, Veronica Hulkeana (flowering grand), Daphne indica (covered with bloom since November). Other Daphnes unharmed are Cneorum blagayana and fioniana; Azaleas (indoor) in many varieties were not touched and are now in full bloom; also Kurume varieties, Lithospermums untouched, Drimys Winteri and Aromatica, Coronilla glauca, Gerberas, Ericas in many sorts; especially good are Australis and A. Mr. Robert Fabiana, Osmanthus Delavaya, Dracænas were unhurt, including red-leaved, Eucryphia pinnatifolia, Leptospermums Nicholi, scoparium, and Chapmani unhurt. All Cistus, the best being Silver Pink, Corypha australis, Grevilleas rosmarinifolia, thyrsiflora, and lutea, Teucrium latifolium (6 feet through), Edwardsia, Buddleia Colvillei, Escallonias in many sorts (Iveyi is the finest), all Abelias, Senecio Greyi (8 feet through), Clerodendrons, Fremontia Cal., Berberis Hyemalis, Viburnum Carlesi. H. L. WALL.

"Craigston," Exmouth, S. Devon.

Primula pulverulenta, Bartley Strain

I HOPED someone would be kind enough to answer my query about the Primula pulverulenta, Bartley Strain, as one is always willing to cater for a lovely plant, but it needs must be discovered and understood. It seems evident that the Bartley Strain is not so universally easy as the crimson type. I cannot help thinking that they do not like a heavy, holding, cold soil, especially where we are, 420 feet above the sea, liable to 30 degs. of frost in winter.

I enclose a photograph if the Editor has room for it. [A very beautiful one, many thanks—ED.]

The question of drainage did not arise here as the plants were on a sloping bank to the stream, and the crimson plants grow to 10 tiers in the same place.

I was disappointed losing my own seedlings, as I generally find once I can get my own seed, plants are so much easier to establish. Perhaps Mr. Dalrymple has not such a cold climate. D. DES VŒUX.

Newbury.

Seedling Begonias

It is seldom that one can have these large enough for bedding-out purposes the first year, and to grow such large number in pots is hardly practicable. In this connection, a good plan is to make up a bed of good compost, under a cold frame, and plant the seedlings therein. In most cases, the plants will bloom well there and so permit of the finer forms and colours being marked for pot culture next year. Keep well shaded from all sunshine.

The Daffodil season of 1929

I HAVE seen some forty Daffodil seasons come and go, and I think that of 1929 has been the worst I ever remember! The poor things have had almost every kind of hard treatment that Nature could deal out to them—intense frost, bitter east winds, and no rain when they most needed it. The frost of mid-April, 14°, spoilt thousands of blooms, all but the late varieties and such as had extra strong stalks went down on their faces to the ground, never to rise again. Many of the flower stems were actually broken—not severed, but what the doctors call a " green stick fracture." Some good comes out of most misfortunes, and this frost did some good in proving which varieties were the best able to withstand severe frost. Florist's Delight took no notice at all, but all stood up as stiff as ramrods. King of May, a very late Yellow Trumpet, Beau Brummel, a Giant Yellow Incomp. Bulwark, and several other Trumpets held their heads up through it all; while others, such as King Alfred and Van Waveren's Giant, suffered very badly.

Here in the Midlands the flowering season was very late, and I was unable to take any flowers to the R.H.S. special Daffodil Show on April 16th. Even as these notes are being written there are still some flowers to look at, including Red Cups, late Barriis, such as Princess Miriam and Lady Moore, King of May, quite good, and quite a lot of Poets; in fact, the latest of these are yet to open.

Strange to say, in spite of the trying weather some few things have been better than usual this year. Fortune, Red Cross, Beau Brummel, Barbaric, Puritan Maiden, Sunset Glow, Advance Guard (early Yellow Trumpet), Princess Miriam, Van Waveren's Giant (2 years down), and Mr. Guy Wilson's King of May.

Fortunately, the long-looked-for rain came in time to help the growth of the foliage, and there is every prospect of a good crop of bulbs, though the flowers were, on the whole, far below the average. Some of the Poets produced very good blooms, John Masefield, Rupert Brooke, Horace, Acme, and Sarchedon in particular. As usual, the Poets which had been in for two years gave the best results, both as to quality of bloom and growth of the plants.

Wake Up, Gardeners!

An appeal for gardeners' orphans

MR. SAMUEL WALLROCK presided at the annual festival in aid of the Royal Gardeners' Orphan Fund at the Savoy Hotel on May 15th. It was one of the most successful gatherings in the history of this deserving fund. In proposing the toast " The Royal Gardeners' Orphan Fund," the Chairman made a touching appeal on behalf of the fund, which is serving such an admirable purpose. The friends of the fund made a ready response to the Chairman's appeal, and by his personal efforts he added 191 new subscribers to the list. The response to the appeal, he said, was most gratifying, but he could not understand the lamentable support that the fund received from gardeners throughout the country. Comparatively few gardeners were keen in their support, others were lamentably slack. After all, gardeners should do something towards providing for their babies. Let this be our motto, he said : " Wake up, Gardeners." We agree with the expression by Mr. Wallrock, and the thanks of all gardeners are due to him for his generous efforts on behalf of the fund. We know only too well that gardeners, as a whole, are not able to contribute large sums—if they were, there would be little or no need for the orphan fund. We know, too, that many gardeners do not contribute direct to the fund, because the amount they could afford is very small! but no amount is too small, and we shall be only too happy to forward to this deserving cause any sums, however small they may be, sent to this office. Moreover, we shall be pleased to bring to the notice of the fund any deserving cases of gardeners' orphans whether from subscribers or not.

Mr. Edward Sherwood, the Hon. Treasurer of the fund, referred to another way in which gardeners may help, and that is by collecting boxes in gardens. He acknowledged with deep gratitude the good service by garden owners who throw their gardens open to the public and make a small charge for so doing on behalf of the fund. Those requiring collecting boxes may obtain them from the Secretary, Mr. A. C. Bartlett, 19, Bedford Chambers, Covent Garden, W.C.2.

To return to the festival gathering,

Supporting the Chairman were Mrs. Wallrock; Lord and Lady Monkswell; Sir Edward Mountain, Bart., J.P.; Sir Percy C. Simmons, K.C.V.O., J.P.; Mr. and Mrs. Geo. Monro; Alderman and Mrs. F. H. Homan; Col. F. R. Durham (Secretary R.H.S.) and Mrs. Durham; Mr. Noel Sutton; Mr. Wm. Cuthbertson, V.M.H., J.P., and Mrs. Cuthbertson; Mr. and Mrs. E. Sherwood; Mr. Leonard Sutton; Lady Humphreys; Miss Edith Eckersley; Mr. George J. Nicholls; Mrs. Fincham
Owen Sebag Montefiore; Mrs. Cecil
Montefiore; Mr. F. A. Secrett; and th
Cannon Hewitt and Mrs. Hewitt.
stewards were Messrs. D. Ingamells,
McCleod, J. M. Bridgeford, G. H. Ba
A. C. Bartlett (Secretary).

A telegram was sent to H.M. the
at the commencement of dinner as an
sion of loyalty and wishes for H.
King's good progress and recovery
return to Windsor.

After the loyal toasts, including H.
Queen, H.R.H. the Prince of Wale
the members of the Royal Family, ha
honoured, Mr. Wallrock gave the t
the Fund. He had, he said, received
of apology for non-attendance from
distinguished people, most of who
sent contributions. They include
Gerald Loder (President R.H.S.
Marquis of Winchester; Lord Riddell
Waring; Lord Dewar; Lord Nelson
Bearsted; and many others. Many o
were new subscribers to the fund.
ing for support for the fund, Mr. W
asked his audience to picture a child
place of a young plant. One knew wh
pened to a young plant if it was not p
cared for, the same applied to childre
felt that 5s. a week was not sufficient
ance, it should be 10s. The Chairman
for more support for the fund
gardeners; a support which was rathe
ing at present. He coupled with th
the name of Mr. E. Sherwood
Treasurer of the fund).

Mr. Sherwood, responding, said th
was instituted in 1887; the first dinne
held a year later. The loss that th
had suffered during the War had,
glad to state, been made good; in fa
sum allowed per week had been incre
7s. 6d. since Easter, and the increa
been received with great gratitude.
had over 70 children on their books, an
year there were more coming on who
the allowance. The fund was
economically managed, the annual e
being only £300 to £400, the Comm
work being a labour of love. He wi
express gratitude to the Chairman
excellent work he had done in maki
increased allowance possible; to the
Associations throughout the countr
made collections for the fund in th
spective districts; to the Committee,
larly its Chairman, Mr. Ingamells,
Secretary, Mr. Bartlett. Mr. Sherwo
referred to the loss sustained in the
during the year, of Lord Lambourn
H. J. Jones, and Mr. C. Dixon.

Mr. Geo. Monro, proposing the
tors," deplored the old days when n
were present at these dinners. He w
to see present, not only many old
but numbers of new friends also.

Sir Edward Mountain, Bart., J.P.,
for the visitors.

The Chairman's health was propo
Sir Percy Simmons, who referred
Wallrock's great gardening interes
very fine garden. The toast was give
musical honours. The Chairman
shortly, after which Mr. A. C.
(Secretary) announced that donations
fund amounted to £1,442.

The last item of the evening
spontaneous tribute to the Secretary
George Nicholls proposed Mr. Ba
health, and it was given with
honours.

During the evening the compan
entertained by Miss Catherine Stewar
Pett Fraser, Messrs. Herbert Sim
Leonard Henry, and Ralph Norris.

arry Miles was again responsible for al decorations, and, as usual, the vere quickly denuded of flowers by esent at the end of the proceedings.

ubscription list included :—

Baibridge.

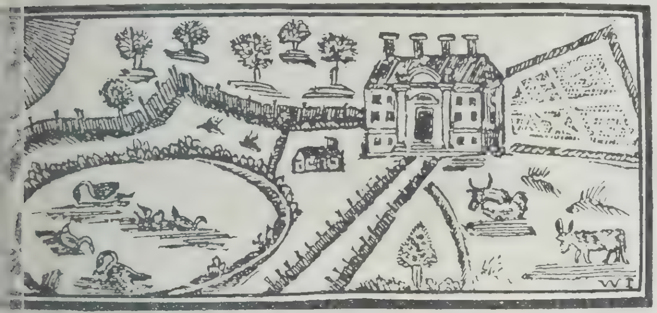
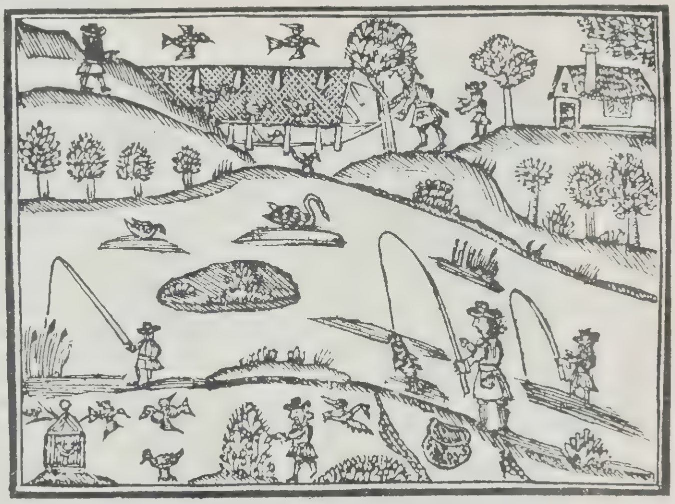
Studley Royal and a Forgotten Poet

AMONG the famed gardens of the eighteenth century, Studley Royal, near Ripon, took an honoured place. Horace Walpole intended to visit it in 1772. "You must be so good," he writes to the Rev. William Mason, "to tell me of my road and if there is anything in my way worth stopping to see—I mean, literally to see—for I do not like guessing whether a bump in the ground is Danish, British, or Saxon . . . . I shall go to Lord Strafford, and thence to make excursions to York, Beverley, Castle Howard, and Mr. Aislabie's."



View of Studley Royal (not to scale)



"Where patient anglers lure the finny tribe"

This last-named gentleman was the owner of Studley Royal, and Member of Parliament for Ripon, and it was the opinion of visitors that the house, with all its elegance, was far outshone by the splendour of the grounds. These gardens found their eulogist in a poet, Mr. Peter Aram, a name unknown to the authors of the Dictionary of National Biography, but one surely that deserves to be preserved in the annals of horticulture. His long, descriptive poem, in which he maintains, for no less than twenty pages, a lyric enthusiasm at a remarkably high temperature, should not be lost to posterity. Studley had, it seems, as every good garden of that century, its cool grots, its cascades, its airy eminences, and other modish ornaments. The artificial mountain :—

> "Where Michells Mount is eminently seen,
> Whose Summit flourishes with Ever-Green."

> "Mazes, like that of antient *Crete* deſign'd,
> 'Mongſt the thick Groves in ſpiral Allies wind.
> But, to my Taſte, the Maſter-Work of all!
> Superior ſhines the Walk of Wattle-Hall:
> Where every Grace and Excellence we find,
> To pleaſe the Fancy, and improve the Mind:
> Long thro' the Windings of the Courſe we ſtray,
> More ſweetly loſt in Pleaſure, than the Way;
> More Beauties riſe, than can with Words be nam'd;
> The more we look, the more we are inflam'd."

It is to be regretted that our poet was not, so far as can be deduced from his work, a serious botanist; he confines himself to genera in a rather suspicious manner, but how can we complain where knowledge is replaced by such enthusiasm ?

> "Dales, once ungraceful and perplext with Thorn,
> Now fragrant Myrtle and green Yew adorn.
> Various Boſcage each *Tumulus* does grace,
> Both the *Perennial*, and the Flow'ry Race;
> 'Mongſt which the Holly in rich Splendour ſhines,
> Adorn'd with Silver and with Golden Spines;
> And *Laurus* too, for which ſtout Gen'rals fight,
> For Whoſe green Wreaths immortal Poets write.
> Here Sucklings ſweet their feeble Branches twine
> Round the ſmooth Trunk of the aſpiring Lime;
> *Mizereon*, *Jeſſamin*, and *Roſes* there,
> With all the Fragrance of the youthful Year;
> The yellow *Primroſe* and the *Violet*,
> Confus'dly ſpring, by Nature's Order ſet;
> Whoſe graceful Odours, mingling with the Air,
> Diffuſe their Sweetneſs, and invite the Fair
> To walk abroad in Gardens, Groves and Fields,
> And view the Beauties which kind Nature yields."

It was, however, to be strictly understood that these shady groves were to be employed only by chaste and discreet lovers, though Aram fully realised the weakness of human nature.

> " Believe me nymphs, it will require
> Your utmost efforts to repress desire."

But Aram shows his greatness never more than in his introductory poem to Mr. William Fisher, the gardener and, one gathers, architect of all these delights.

Too often do we forget the real and " onlie begetters " of our beloved gardens, their work remains but their name passes into an undeserved oblivion. I cannot do better than quote, in conclusion, this precious witness to Mr. William Fisher. It may be that we have no more an Aram in our midst, but we in England know—who better ?—that the art of Fisher still lives and flourishes.

TO
MR. WILLIAM FISHER,
GARDENER in Chief
To the Right Honourable
JOHN AISLABIE, Efq;
At STUDLEY.

No meaner Art, and no inferior Toil,
Could give fuch Rules, or fo adorn the Soil.
'Tis juft that He, who did thefe Scenes contrive,
Should have his Memory preferv'd alive;
That future Ages by thefe Lines may know
What to ingenious FISHER's Name they owe;
(If fuch as thefe can Names immortal make,
And of ETERNITY a Share partake:)
Whofe happy Genius has in Planting fhown
Arts more polite, than to our Fathers known;
Adept in all the GARDEN Myfteries,
Of Herbs and Flow'rs, in Legumes, and in Trees;
Their various Qualities and Habits fhow,
How beft to plant, and when the Time to fow:
To each its proper Soil, and Afpect, give;
Tell where it will, and where it will not thrive:
Learn'd in Defign of quick inventive Thought,
That has this PARK to fuch Perfection brought:
Each Spot, being emulous to pleafe us moft,
May fome peculiar Grace and Beauty boaft.
The whole Compofure's of fo fine a Frame,
That Art can add no more, nor Envy blame.

Ye Pow'rs! who over Flow'rs and Trees prefide,
For Him a Wreath compos'd of each provide,
Of niceft Texture and delightful Hue,
Place on his Head, an Ornamental Shew:
There in full Luftre glitter on his Brow,
Thofe Plants and Flow'rs, which by his Hand did grow.

It is, perhaps, well to say that Aram's Poem is to be found in " The Ancient and Modern History of the Loyal Town of Rippon," by Mr. Thos. Gent, printer, York, 1733.

E. A. Bunyard.

Drimys Winteri, or Winter's Bark, now flowering in a Cornish garden

Flowers pale yellow with green carpels

This plant was brought home by Capt. Winter (after whom it was named) in one
Drake's ships from the Magellan Straits

Notes from a Cornish garden

(Continued from page 341.)

ONE thing I was shown in the other garden I visited down west which made me think, and that was a couple of scented Rhododendrons, which I was told had been in pots for 30 years. They were some 6 feet high and had been frequently cut back, but even then it seemed almost unbelievable. Some of my more tender hybrids are going back into pots as a consequence, but it is an undeniable risk, owing to the difference of conditions. In the case of the plants mentioned there is a first-class gardener in charge, who scarcely ever leaves them, whereas here they would be looked after by a mere amateur whom untoward circumstances occasionally takes away from home, and who has no one really efficient with whom to leave them. Nor is there here any room in the one greenhouse, and the big frame is but 4 feet high, so that they will soon grow out of it. And when they do, woe betide them, for a plant that has long been confined to a pot does not readily spread from its ball when it is put in the open ground.

The past winter has, of course, been a severe one, and certainly some plants have suffered badly even in Cornwall, yet there are remarkable exceptions. Rhododendron Lindleyi under a north wall here has 32 trusses on it, and, curiously enough, came out some days before another plant near the south wall, which had but 14. But that is probably to be accounted for by the absence of rain.

A hybrid, Lindleyi x bullatum, is also covered with flower under the north wall, and further afield I see that two large bushes of R. Aucklandii are promising well. The explanation appears to be that the frosts were continuous, did not begin very severely, and were not interrupted by warm spells that excited the plants into premature growth.

And now the fates have again taken me to the garden in the west, where I stayed for the Truro Flower Show, and there, during the intervals of justifying my existence by doing some potting and pricking out some seedlings for the head gardener, I have made the acquaintance of a good many
hitherto scarcely appreciated. There

RALPH E. ARNOLD.

Manuring the Rose garden

Now that the Rose bushes are pruned, something in the way of food will have to be applied to their roots. Of course, newly planted Roses had some good fresh stuff placed about their roots when they were planted. This, with liquid when they are in full growth and the ground moist, will keep them going for a season. It is, however, quite different with established plants. They must have something good or the results will be poor. The Rose, like other plants, seems to prefer a change of food.

When the soil is of a retentive nature, decomposed cow manure carefully forked in about their roots serves the purpose very well, and eventually acts as a rooting medium. Burying the manure is an important operation, for if the digging fork is carelessly used among the roots much harm may be done. In Rose beds and borders, where the soil is not so retentive, bonemeal appears to act well as a food. Rose plants that have been fed with decomposed cow manure for a time relish a dose of bonemeal by way of a change. Wood ashes, when they are to be had, are also an excellent food for Rose plants.

During the growing season, if the soil is not moist with heavy showers, the hose-pipe should be used. Liquid manure is applied, and, failing liquid, "Roseate" Rose manure comes next; but the latter must be applied with care. A handful dissolved in a three-gallon canful of water is a fair amount for a start; as the season advances and the roots of the plants become more numerous, the quantity of either the liquid or Roseate may be increased.

JAMES A. PAICE.

"Copseham," Esher.

Daphne Cneorum (the Garland Flower)

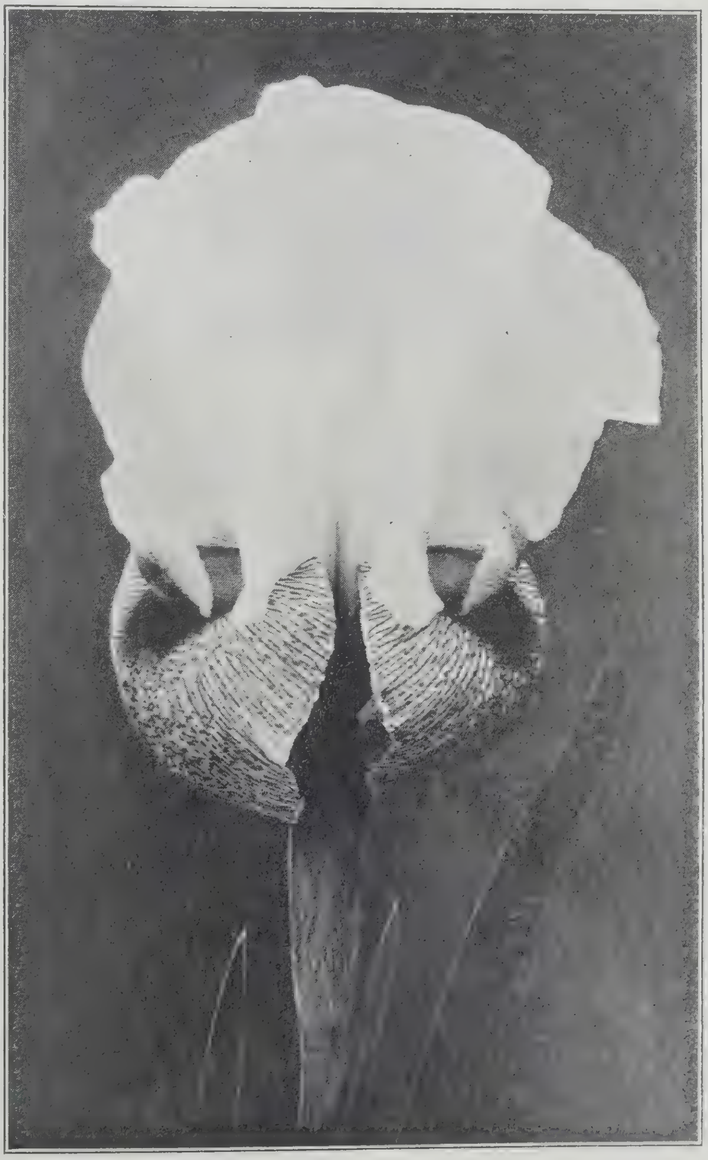
This beautiful shrub is indispensable in the rock garden. It has a nice dwarf spreading habit, is only 12 inches high, and produces rounded heads of vivid pink flowers, which are deliciously fragrant.

It commences to bloom in April, continuing well on until the end of May, looking like a large pink cushion, for it completely hides its evergreen foliage when in flower.

Daphne Cneorum is of easy cultivation provided it is planted in peaty soil and has good drainage. The flower heads should be cut off carefully when past their best to keep the shrub in vigour.

This species is best propagated by layers, also by cuttings of ripened wood in the autumn.

R. MOORE.



Iris Lorteti, a bulbous species with large, spreading standards

Rare and difficult to cultivate

-and so to Chelsea!

A Brilliant Pageant of Flowers — Many New Exhibitors — Magnificent Tulips

THE glorious weather of the Whitsun holiday continued to the opening day of the show and is reflected in the bright and brilliant pageant of Chelsea. Year after year a higher standard of excellency is reached at Chelsea, and this show is in many ways an advance on those that have gone before. Perhaps the greatest advance is seen in the formal, woodland, and water gardens seen outdoors in the main avenue. Some of these really beautiful gardens are illustrated in this report. When we compare these gardens with those of seven or eight years ago we must be impressed by the advance in design, construction, and planting that is taking place year after year. Greater imagination is still required—the modern garden, like the modern house, is undergoing a great change.

A good deal of forcing has been necessary to make this show a success. There is no need to remind readers of the cold and backward spring and the great difficulties that exhibitors have had to contend with. But difficulties, so far as nurserymen and seedsmen are concerned, are only made to be overcome. Never before have we seen Pæonies so well shown. These alone provide a triumph of the skill of present-day cultivation. The Irises again are extremely good, so are the Rhododendrons, Azaleas, Roses, Lilies, Carnations, Salpiglossis, Calceolarias, and Sweet Peas, while the Tulips are finer than ever. Barr's are showing the most magnificent collection of Tulips we ever remember seeing at Chelsea.

The Sherwood Cup, the blue riband of the gardening world, once more goes to Sutton and Sons for their magnificent collection of flowers and greenhouse plants from seed.

The Cain Cup for the best exhibit by an amateur is won by the owners of that famous garden at Bodnant for a most interesting collection of Meconopsis, Rhododendrons, Primulas, Cypripediums, and other treasures of a great garden.

One of the earliest visitors to the show was our founder, William Robinson. Princess Mary shook hands warmly with him when they met in the large tent before a group of Lilies in which he was so much interested.

The organisation and arrangements of this great show are better than they have ever been, and our thanks are due to Col. F. R. Durham, the genial Secretary of the Royal Horticultural Society, and to Mr. Simmonds, the Assistant Secretary, without whose help we could not publish this report while the show is still in progress.

Among the new noteworthy plants are to be seen that rare Gesnerad, Jankæa Heldreichii, closely allied to Ramondia, the yellow-flowered Pæonia Mlokosewitschii, Campanula rupicola, Magnolia Brozzonii, and Rhododendron Vanessa, the two last gaining the coveted First-class Certificate.

A number of new Daffodils are sh
mostly Poets, and some receive the Aw
Merit.

THE FORMAL, WOODLAND, A WATER GARDENS

There are a larger number of fo
woodland, and water gardens shown
ever before, and they are more diversif
character. They are therefore more h
to those who wish to get some good ide
the layout of their own gardens, or ar
haps desirous of making some alteratio
additions to them.

Some of those shown give a beautifu
of how a small suburban plot migh
treated, while others seem more su
for the treatment of a small portion
large garden.

We always look forward to seeing the
of such a past master of the art as M
Wallace. Many readers of GARDENING I
TRATED and visitors to the Chelsea Sho
year will remember the charming inf
Japanese garden exhibited by him

n-house there is a stone gateway with
ght-iron gate of graceful design. The
garden is surrounded with a Thuja
, in part of which are planted Azalea
in variety. On the right side of the
n Azalea mollis (J. C. Van Thol),
s Japanese Acers, and Cytisus præcox
laced. Four very fine lead vases stand
e flight of steps, in which are planted
aenas. A narrow stone edge under the
walls of the sunk lawn allows of easy
g of the turf and attention to the flower border without spoiling the appearance of the lawn.

"Garden Services" are exhibiting a formal garden with a garden-house of classical design the sides of which are draped with Wistaria. This garden is flanked with tall evergreen shrubs. A small pool is placed in the immediate foreground above which is a raised terrace and the low retaining wall above the pool is left undraped.

Mr. N. I. Baggesen, of Pembury, who gave us the charming monastery garden a year ago, is showing an old Devonshire garden, quite informal in character. In the centre a winding stream flows rippling down into a quiet pool of irregular outline, the rocky sides of which are festooned with dwarf-growing plants. At the far end of the garden stands a Heather-thatched garden-shelter, and in front of it stands an old pump. The overflow from it empties into a weather-worn stone trough. A quaint old-fashioned straw beehive and leaden pail of antique design, and in reality at least 500 years old, give an old-world character to the whole garden.

Messrs. J. Cheal and Sons have constructed a formal garden with a lawn in the centre, beyond which there is an imposing pergola of deep red brick, approached on each side by a short flight of steps. The pergola itself is draped with Wistaria, Vitis, and climbing Roses. The garden is surrounded by a Yew hedge, in front of which there is a herbaceous border. Between this and the lawn a broad path runs, paved with York stone, and in the centre of the path oblong beds are placed filled with dwarf Polyantha Roses. In the immediate foreground a fine bank of Rhododendrons and Azaleas is placed. Between the oblong Rose beds quaint specimens of topiary work in Yew break the somewhat severe outline of the long, straight path and beds.

Messrs. W. Cutbush and Son, Ltd., have constructed a "hill and water garden" in the Japanese style, but without any artificial or man-made ornaments of any kind.

From turf-clad hills a winding stream flows down, and the banks are clad with plants and shrubs suited to the situation. Rhododendrons appear at the edge of what we might imagine to be a forest and merge into Heaths. As the little torrent is approached a few Pine trees crop up, and in the boggy ground below them characteristic plants appear. At the edge of the pool and stream, among stones and shingle, and also in the turf, charming groups of Primula japonica are to be seen, while among the rocks above them are Japanese Azaleas and the smaller-flowered Rhododendrons. The garden is enclosed by a belt of wonderful flowering trees and shrubs, and on the right-hand side may be noted Pyrus floribunda atrosanguinea and P. f. Aldenhamensis.

The idea is a well-conceived one, but the hills are too much alike in form to appear natural, and the introduction of putting greens with their red flags mars the picture, and indeed appears out of place in close proximity to plants which are easily injured by golf balls.

William Wood and Son, Ltd., of Taplow, Bucks, have constructed a typical "Garden of Japan." On the sides of the central informal lake, with its low stone bridge, may be found "The Stone of Worship," "The Moon-gazing Stone," "Seat of Honour," and "Perfect View Stones." On the right-hand side of the Teak-wood tea-house there is a picturesque "Snow-viewing Stone Lantern," with its widespread flat top, and on the left of the lake there is a fine "Kasuga" stone lantern. A notable feature of the garden is a cascade, some 6 feet in height, from massive rocks. On the left-hand of the fall may be seen "The Guardian Stone," while a little further to the left the "Cave Stones" find a place. The tea-house is draped with Wistaria and Vitis. Among the masses of grey rock on the left side of it blue Hydrangeas and the deep orange Lilium umbellatum are to be seen. Beautiful groups of Japanese small-flowered Azaleas and white Lilies also find a fitting place. The garden is shut in on the left side by a range of turf-clad hills and tall-growing Cerasus Hizakura.

Mr. McDonald again exhibits one of his inimitable grass gardens. In the centre of a wonderful lawn a fountain stands, and from a bronze Cupid a fine single jet rises. At each corner of the lawn a square bed filled with golden Phleum aurea is placed, and all round the garden silver-toned grasses stand out against a background of Yew.

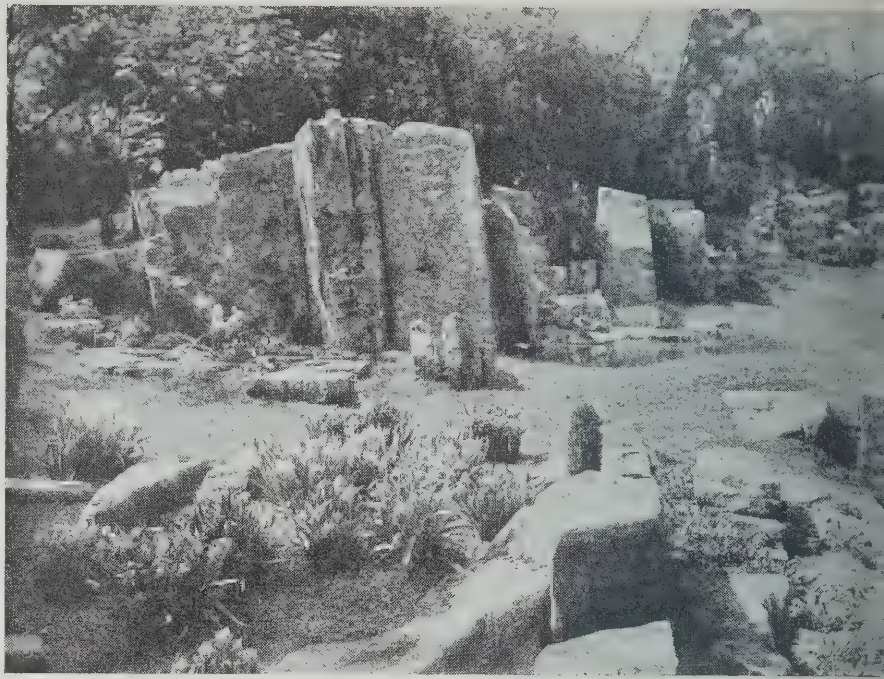
Ernest Dixon, of Putney, is showing a sunk garden of unique design, measuring only about 30 feet square. In the centre a charming bronze figure stands, and at each corner of the garden a circular-seated recess is placed. Between three of these recesses a flight of steps leads down into the garden, while on the fourth side the low retaining wall is draped with Alpine plants, and the bed above contains various herbaceous plants, backed by shrubs and small trees.

View of rock gardens on the eve of the Show

Rock gardens on the opening day

THE ROCK GARDENS

Some months since, the Council of the R.H.S. appealed for a change of material in the construction of the rock gardens. The fact that there are six out of the ten on the bank usually devoted to this class in grey limestone suggests that the appeal was not altogether successful. Be that as it may, we must say that if the four examples of rock gardens built with other stones are the best that can be produced then it is just as well all the exhibitors did not depart from their recent custom. There can be no shadow of doubt that the outstanding exhibits are those constructed with the grey limestone. On the whole, this section of the show presents a less attractive appearance than usual, despite the magnificent efforts made by two or three exhibitors. It would almost appear that during the past few years the limit of ingenuity has been reached and that we can look for no more advance. This is regrettable, and the more so because there is not the same uniformity of excellence throughout the exhibits as we have seen on some previous occasions.



A rock garden in surface weathered granite from the gigantic screes of the Snowdon range. Shown by Mr. Gavin Jones

There are two examples, side by side, that could be described by using exactly the same words for each, although to the close observer there is a wide distinctiveness in individual treatment. Messrs. Pulham and Mr. George Whitelegg have adopted very similar plans. Of the two Mr. Whitelegg's work is the bolder, and conforms in every way to the magnificence of effort we have grown to expect from him. It is so easy to criticise, and so difficult to realise all the difficulties an exhibitor has to contend with, but we think a little more restraint in the use of stone would have given greater prominence to the best work in this exhibit. As we studied it we felt we would like to wipe out a spot here and there with a brush if it were possible. At the same time, we must admit that the very incidents we would eliminate are individually examples of very fine work. It is only that just where they are they appear to be superfluous and do emphatically detract from other and more interesting formations. Nevertheless, the whole of this exhibit is worthy of close and studied inspection. Expert or novice will find many attractive little bits that are poems of beauty in themselves, and save for this one aspect of multiplying effects in a limited space the whole treatment is very successful and nobly conceived.

The torrent, for there is no other name for it, is cleverly managed and truly natural. The scheme as a whole is intelligible, and carries with it the conviction that here Nature has been idealised rather than slavishly copied. So far as planting is concerned the results are very satisfactory. There has been no effort at window-dressing; indeed, many of the choicest subjects have been so placed that it needs the eye of a connoisseur to detect them in their charming recesses. The collection of Alpine plants used is a tribute to a nurseryman's ingenuity after one of the worst seasons on record. In this exhibit the rock chosen is the Cheddar limestone.

Messrs. Pulham have preferred to use the Westmorland limestone, and have a
very successful results with it. Th

SWEET PEAS

The display of Sweet Peas of Mr. Robert Bolton, Birdwood, Essex, is a triumph of the floral decorator's art. It contains from 50 to 60 vases and stands of wonderfully well-grown flowers on stiff, erect flower-stalks, and the quality and colour of the flowers are superb. This group is set up on the east side of No. 2 Tent. The flowers are arranged very deftly so that they can be seen quite easily and their individual beauty fully appreciated. Special attention is merited by the following superb varieties:—Mrs. A. Searles (very distinct), Mammoth (orange-scarlet), Magnet (cream-pink), Jessie (cream-pink), Gold Crest (salmon-orange), R. F. Felton (still the best lavender), Royal Mauve (rich, bright mauve), Susan (blush-pink), What Joy (cream), Beatall (lovely rose-pink), and a host of other equally good things.

A well made grass lawn and formal garden by En-Tout-Cas Co., Ltd.

On the west side of No. 1 Tent Messrs. Dobbie and Co., Ltd., Edinburgh, have set up a pretty table group of Sweet Peas arranged in stands, vases, bowls, etc., in very pleasing manner. There appear to be about 40 different receptacles, artistically displaying these beautiful sweet-scented flowers. Varieties that call for special notice are the following:—Chieftain (light mauve), Daffodil (cream), Mary Rose (true rose-pink), Austin Frederick (improved lavender), Magnet, Pinkie (pink), Olympia (deep purplish-mauve), Blue Bird (soft lavender-blue), Constance Hinton (white), Flamingo (orange-scarlet), Powerscourt (soft lavender), Youth (white, with picotee edge), Matchless (cream), and Picture, still one of the most charming Sweet Peas.

Messrs. Alex. Dickson and Sons, Ltd., Belfast, in No. 2 Tent, also display the Sweet Pea in most noteworthy fashion. We are so glad to see they have got away from arranging the flowers in the formal manner they have observed in recent years. Their exhibit on this occasion represents the Sweet Pea in stands, baskets, and vases. The flowers are of splendid quality and represent many of the newer as well as standard sorts. We could not fail to make a note of the following sorts, all of which are worthy of inclusion in most collections:—Mammoth (orange-scarlet), Powerscourt (pale lavender), Wizard (orange), Hawlmark Mauve (rich mauve), Sunkist (cream Picotee), Hawlmark (salmon-pink), Mrs. A. Searles, and Supreme (soft pink on white ground).

Splendid quality characterises the display of well-grown Sweet Peas by Mr. J. Stevenson, Wimborne. This exhibitor sets up his handsome flowers in bowls most effectively. His Sweet Peas are some of the best in this show, and the 20 stands are arranged with skill and beauty. His finest varieties are Treasure (mauve), Charm (scarlet), Bullion (orange), Purity (white), Lustre (bright rose), and Honour (red).

CACTI AND SUCCULENTS

The quaint and curious plants are well shown by Mr. T. M. Endean, Laindon, Essex, on a table at the Chelsea Hospital end of Tent No. 2. The plants are well grown and represent many of the better Cacti at their best. Some of the varieties are represented by large plants in the pink of condition. There are about 150 kinds and varieties. We were much interested in the following varieties:—Echinocactus pilosus, E. Grusonii, E. cylindraceus, Mamillaria glauca, M. cirrhifera longispina, M. Fischeri, M. celsiana, M. Bockii, M. candida, M. bicolor var. Nivea, M. heeseana, M. spinossima var. sanguinea, Pilocereus senilis, P. Hoppenstedti, P. Houlletii.

CARNATIONS

Chelsea Show has been the scene of the finest displays of Carnations seen in the whole world, and those who follow the exhibits from year to year wonder whether anything better can be done than in the past. In Mr. C. Engelmann's magnificent display it is evident that progress is made from year to year in the matter of varieties. Among his novelties Sunny stands out as a colour which is wanted, being a bright shade of orange.

His novelty for next year—Wanda—is the next best thing, which, although a Perpetual, is as large as a Malmaison, of a deep, clove colour. His novelty, Zorro, of last season was looking as well as any in the mauve class, with a ray of pink. It is not so large as Circe, but much more free blooming. The whole display forms a huge floral trophy.

Messrs. Allwood Bros., of Haywards Heath, always aim to arrange in a different style to that seen at other times of the year. In the style and lay-out of a garden, with large and prominent stone vases containing masses of fine flowers, the effect is excellent. Their novelties, likewise, include a development in colour; the Maud Allwood, a deep orange with some flakes; Guy Allwood is a bright salmon. Their new Buttercup yellow is aptly named Buttercup. Realistic beds of Dianthus Allwoodii are very attractive, and this is undoubtedly the best way to show such a plant. Even the popular Alpine Pinks for rock gardens are well represented in beds to themselves.

Messrs. Stuart Low and Co.'s group of Carnations from their two places at Crowborough, Sussex, and Bush Hill Park, Enfield, was a display more of choice varieties of their own raising rather than in extent. Their novelty, Kathleen, is the deepest in the salmon class. Thomas Ives, cerise, has the largest petal found in any Carnation. R. A. Nicholson retains its bright scarlet shades as well now as in mid-winter.

New Carnation Guy Allwood (Award of Merit, May 7th)

Flowers of a lively pink, an improvement on the well-known variety Laddie

Countess of Harewood is a deep rose of
ticularly fine form. Ann Horton is a d
porcelain, white picoteed carmine. Bar
Schroder and Hilary are other noveltie
this season's introduction in the fancy
Messrs. Low are among the few nursery
who still grow Malmaisons, both perp
and the old type. Nothing excels them
course, for size, and in this respect the
Charlotte Knollys excels.

A fine quality, but smaller group of th
type of Border Carnation is arranged by
Jas. Douglas, who has flowers of exqu
finish. His Scent of Cloves—white, sal
pink, etc., are always popular.

Novelties, as well as such old favourit
Miss Schiffner and Lieut. Shackleton,
well represented in the beds of Border
ations arranged by Messrs. Lowe and Gi
Crawley Down. Messrs. Lowe and Gib
method of showing their Carnations is e
lent; all the side buds are left on the gro
plants. Old Lady Hermoine is still or
the best salmons. Grey Douglas, the
French grey mauve, and Rose Clove
also prominent.

In the Carnation section, Mr. C. Herb
display of Perpetual Pinks, which he br
from Acocks Green, Birmingham, are al
a unique lot. He continues to enlarge
range of colours, so that most of the sh
are now represented. Prince of Or
(scarlet), Delight (light salmon), Fa
(rose), are among his best.

Messrs. Keith Luxford and Co.,
bridgeworth, arranged a group of Perp
Carnations of first-rate quality. Their
standing vases being the fragrant c
coloured Sir Philip Sassoon, and the b
salmon Eileen Low. The vivid scarlet
trum looked well in contrast to the de
scarlet Brilliant.

TUBEROUS-ROOTED BEGON

Messrs. Blackmore and Langdon, T
ton Hill Nursery, Bath, well maintain
high reputation as exponents of the cul
tion of the Tuberous-rooted Begonia.
table group is set up on the east sid
No. 2 Tent, and is represented by a g
bank of well-grown double-flowered sor
superlatively fine condition. To have trav
so far without damage to the blooms
remarkable testimony to their method
packing these somewhat heavy, fr
flowers. A few of the more noteworthy
in this unique collection are the followin
Mrs. H. W. Allan (rich salmon), Lady
(terra-cotta salmon), Queen of the Belg
(frilled salmon), Sidney Robinson (ora
Lucy V. Toner (cerise), Mrs. D. B. C
(flesh-coloured), Albatross (pure white),
Langdon (rich flesh-pink), Princess Vic
Louise (flesh-salmon), C. E. Pearson
liant scarlet-crimson), John Mercer (ora
Mrs. J. Raeburn Mann (cerise-pink),
Mrs. H. Moncrieff (frilled pink). This be
ful group was interspersed with Ferns
edged with Panicum variegatum. There
nine stands of basket Begonias arrange
elegant stands most attractively.

Messrs. Sutton and Sons in their la
comprehensive group in Tent No. 1 also
a large mound of well-grown do
Begonias, illustrating the fine quality of
seed of the double-flowering kinds.

HYDRANGEAS

At the Embankment end of No. 1 Tent
H. J. Jones, Ryecroft Nursery, Lewis
S.E., has a large and comprehensive g
of Hydrangeas, consisting mainly of rec
introduced novelties and many choice see
varieties of his own raising. There are
many of the standard varieties of pr
merit. Some of the more noteworthy ar

l, Blue Prince, Goliath, Maréchal h and Florence Bolt. Superb novelties M Jones' own raising are D. B. Crane right), J. F. McLeod, David Ingamells, Mary, Duchess of York (deep rose), s Elizabeth, Lord Lambourne (deep e), and Adelaide. The group is lightly tistically arranged, and is attractively l with Ferns and foliage plants.

rs. John Peed and Son, West Nor- S.E., in their group of miscellaneous and greenhouse plants included an ting series of Hydrangeas.

OVE AND GREENHOUSE PLANTS

rs. James Carter and Co., Raynes S.W., have, as usual, one of their very ive and highly interesting exhibits, ing a very large area in No. 1 Tent, ing a series of popular greenhouse eng plants shown in excellent form and on. Some of the more noteworthy es are a fine lot of Carter's Invincible -wonderful markings and glorious Calceolaria Victoria Prize, Schizan- utterfly, is a beautiful branching form e flowers in many shades of colour- pecial attention must be called to the t colouring of some of the flowers. is a beautiful strain of Streptocarpus sing tones of new colours, choice Amaryllis, Cineraria stellata Cactus, intermediate type of Cineraria in and coral shades. We must not omit tion the splendid lot of Sweet Peas ively set up in bowls on standards. group is finished off in neat and g fashion.

eolarias as shown by Messrs. Dobbie o., Ltd., Edinburgh, create a floral that will not be easily forgotten. On st side of No. 1 Tent this firm exhibit of large, well-grown plants in the of condition, represented by large beautifully spotted and marked. The larias are interspersed with beautiful ums and a background of Palms.

e same tent Messrs. John Peed and Vest Norwood, S.E., display on the t ide a most interesting collection of and greenhouse foliage and flowering nt Stately Palms form a background, the group is a capital selection of ums, for which this firm is famous. rthy varieties are Triomphe de Comte, Sutcliffe, Dr. Friedleben, Tomasso, nsign, Fiery Cross, Mrs. C. Cooper, Dahle, Marquis of Camden, John Peed, urns, Mme. E. Pynaert, Reine Marie tugal, and Roupell Glory. Dracænas otons in variety are freely shown also. of the chaste Lilium longiflorum um and L. l. formosum are well dis- There are also a grand lot of Strep- s, Gloxinias, and Hydrangeas, all of combine to make a highly attractive autiful group.

o. 2 Tent cut Zonal Pelargoniums are by Mr. W. A. R. Clifton, Willingdon, The flowers are arranged in stands able and represent many well-known pular varieties, such as Jupiter, Olive D. Slade, P. R. Johnson, Hockey, , Pride of the West, and Pride of among the single-flowered kinds, and re many good double and semi-double d varieties.

e Chelsea Hospital end of No. 1 Tent Sutton and Sons, Reading, stage one very fine groups of flowering plants eed. The vastness of this group can- to impress visitors to this great show. re to be seen at their best wonderful ossis represented by large blooms in usses and beautiful colourings. The ous Calceolarias are very handsome, charmingly varied in colour, and the plants are wonderfully well grown. There is also a very good strain of Schizanthuses to be seen in this group, magnificent Begonias and Gloxinias, and a very handsome strain of Streptocarpus, represented by plants in ideal form and condition, and there is also a grand mound of Star Cinerarias. We noted some splendid specimens of the stately Clerodendron fallax and a grand lot of Begonia Lloydii suspended from the roof of the tent, as it were, from hanging baskets.

On the west side of the Chelsea Hospital entrance to No. 1 Tent Messrs. L. R. Russell, Ltd., Richmond, have a group of choice stove and greenhouse plants arranged in most artistic fashion in which full advantage is taken of the beauty of the many subjects set up. A background of Palms and Tree Ferns give this large group a light and airy appearance. The group consists of numerous well-grown plants, such as Croton Reidii, C. Warrenii, C. Eugene Draps, C. Emperor Alexander III., C. Golden Ring, and C. Prince of Wales. Dracænas are represented by such sorts as D. Victoria, Nonpareil, Jamesii, Admiral Beatty, and Eugene Andri. There are several excellent forms of the Alocasia, such as A. Watsoniana, A. crystallinum longifolium, A. crystallinum, A. argyrea, A. argentea, A. Mortefontaniensis (very distinct), A. Rhodigeania, and other good sorts. There is a plethora of beautiful subjects in this group in which the lover of exotics should revel.

A small group of Fuchsias are shown at the Embankment entrance to No. 2 Tent by Mr. H. A. Brown, South Chingford, London, E. 4. This exhibitor shows many plants in pots and a series of standards. Some of the better sorts are Fascination, Ballet Girl, Scarcity, The President, and Elsa.

Also in No. 2 Tent is a table group of cut Zonal and other Pelargoniums, shown by Mr. R. J. Case, Taunton. There are some very brilliant singles, of which the more striking are Exquisite, Drummer Boy, Paul Crampel, Somerset Lad, Tauntonian, Sensation, Mrs. R. J. Case, Orange King, J. C. White, and the beautiful Pride of the West. Good semi-double sorts are Chavarri, Hermanos, The Speaker, Genitrex, President Baillet, and Mme. Breton Duverney.

On the west side of No. 2 Tent Messrs. Stuart Low and Co., Enfield, Middlesex, stage a very interesting group of miscel-

Tropæolum azureum, flowers violet-purple, white centre (Award of Merit)

A remarkable climber from Chili, suitable for a cool greenhouse. Shown by Clarence Elliott laneous stove and greenhouse plants, all of which should be of great interest to the amateur. Among other subjects there are to be seen good examples of Calla elliotiana, Brugmansia Knightii, Gerbera hybrids, Aotus gracillima, Anthuriums, Ericas, and Azaleas.

A useful table group shown by Mr. W. E. T. Skilton, Bromley, Kent (gardener, Mr. W. Wiltshire), represents Spiræas, Herbaceous Calceolarias, Schizanthuses, and Cinerarias, together with foliage plants as an embellishment. The plants are beautifully fresh and clean, and tastefully arranged. We welcome this exhibit of a private grower.

On the east side of No. 1 Tent Messrs. Webb's, of Stourbridge, show Schizanthuses in grand form and condition. The centre of the group is filled with this subject flanked on either side with well-grown plants of Cineraria stellata and a grand lot of their superb strain of these plants. Herbaceous Calceolarias are also shown in good form. An exceptionally good strain of Primula obconica gigantea is a striking feature; so, too, are the Clarkias. Altogether it is a splendid effort, and does this well-known firm much credit.

Also in Tent No. 2 a pretty table group of well-grown Calceolarias is shown by Mr. H. P. Russell, Bexley Heath (gardener, Mr. G. Tyderman). The colours are pleasingly diverse, the plants well grown, and the strain good.

ROSES

Looking at the Roses at Chelsea old visitors who remember the Temple Show are reminded of the delightful displays seen there 30 years ago, when they were always among the best things in the show. A special tent is now occupied by the Queen of Flowers and is made the first place of call by many visitors. There can be no question that in a group of Roses standards grown in pots fill an important rôle. First-class flowers carried above the others on bush plants are irresistible. Messrs. B. R. Cant's display had wonderful flowers of their Mrs. Beatty, the sweetly scented yellow dwarf H.T. so much like Maréchal Niel and some points superior to their already popular Rev. Page Roberts. Lady Wakefield is an apricot sport of Padre. Nothing excels the perfume of Souv. d'Un Old Rose Garden.

No firm has done more to popularise the dwarf Polyantha Roses than Messrs. Cutbush and Son, who send from their Barnet nurseries their charming yellow Sunshine, which is quite reminiscent of W. A. Richardson in a dwarf form, with delicious scent. Arranged through the whole length of the tent and down the centre of it, with the layout of a Rose garden, it correctly represents what the Polyantha Rose can do. The brilliant orange-scarlet Mrs. A. Hudig is most effective for a dazzling effect.

Another scarlet Polyantha, Gloria Mundi, was shown by Messrs. Shedrecht, but enthusiastic rosarians may prefer to wait and see this grown in the open, as the flowers exhibited came from under glass, and the colour may not be quite the same in the open.

Messrs. Frank Cant's fine group contained many promising varieties. Particularly fine were his standards of Florence Izzard, the deep yellow, and C. P. Kilham with its bright orange-apricot centre and perfect shape. Maud is reminiscent of a large Los Angeles.

Chaplin's Pink Rambler, The Beacon (bright red), and Paul's Scarlet Climber were a feature of Messrs. Chaplin's group. Associated with such climbers are the dwarf Polyantha Else Poulsen, which bright rosy-pink variety can be included among the best half-dozen dwarf Polyanthas. Although a single, it is considered by many to be superior to the H.T. Dainty Bess (of the same shade) for bedding. White Echo is a good white Polyantha Rose.

Mr. Elisha Hicks brought from Twyford many climbing and rambler Roses. Those fine dwarf pink Polyantha Roses, Ellen Poulsen (double) and Else Poulsen (single), are very effective. Golden Gleam is a good bright yellow Hybrid Tea. Dame Edith Helen, one of the best of all rose-pinks, was also looking well on growing plants.

Mr. George Prince, Oxford, has in his group outstanding Coral Cluster, a pale variety, and Golden Salmon Polyantha varieties. The deep crimson "Daily Mail" scented Rose is well shown.

An old name in the Rose world which brings up many memories is that of Paul, of Cheshunt. Messrs. Paul, the successors of the old firm, are well represented by the ever-popular Mme. Butterfly, Roselandia, Lady Sylvia, a splendid pink sport of Butterfly and such fine Roses.

Messrs. Alex. Dickson and Sons, Newtownards, are represented by several of their novelties. Flamingo (brilliant orange-cerise) appears good in every way. Edith N. Perkins is a remarkable contrast in colours, pale coral-carmine outer petals, with vivid apricot-coral centre. Canary is bright yellow.

Pemberton's Roses from Havering are now a class to themselves. Vanity, an old rose semi-double decorative variety, is charming in the garden. It is doubtful if his variety, Ruth, has ever been appreciated as much as it deserves. Havering Rambler is a dainty type of coral-rose.

Mr. Walter Easlea has several varieties distinct from others, but outstanding as the best is C. P. Kilham, far superior to Lady Inchiquin.

Madresfield Court Gardens, Ltd., from Malvern, are represented by a neat group of Polyantha Roses of varieties already mentioned.

VIOLAS

Messrs. Chaplin, Waltham Cross, have a table group of Violas, individual plants being arranged in Cocoanut-fibre refuse effectively interspersed with small Ferns. Here are to be seen superb examples of such fine varieties as Fred Williams (mauve), Andrew Stevenson, Rosy Bell, Archibald Campbell, Mrs. M'Ewan, Eileen, John Adamson (yellow rayless self), Kathleen, Master Banks (query Lingii), Mrs. Fincham, Annie Hamilton, Dr. McFarlane, Arkwright Ruby, and Swan.

In the same tent Messrs. Jarman and Co., Chard, display baskets of cut Violas, embracing some of the larger varieties, such as Mrs. Fisher, Moseley Perfection, and quite a lot of varieties of the Gracilis type of flower, such as Wyndley Gem, Velvet Queen, Heavenly Blue, Golden Spur, and Viola Cornuta, Jersey Gem, C. alba, and C. Mauve Blue.

In Tent No. 2 Mr. H. Clarke, Taunton, shows some very large and handsome Violas, all giving evidence of good culture. The blooms are arranged in dainty green-painted baskets and are most effectively staged. A few of the better varieties are Lady Knox, Rowan Hood, Mrs. Fisher, Mrs. Beckett, Mrs. J. Mason, Annie Hamilton, Baron Newlands, and John Adamson. There is a pretty display of V. Bosnaica var. Crimson King in this stand.

Messrs. W. Keep and Co., Crews Hill, Enfield, in their table group of Alpines in No. 2 Tent have a pretty lot of bedding Violas in bunches. Popular varieties worthy of mention are:—Stanley Saul (mauve), Swan (white), Primrose Dame (primrose), Mauve Queen (mauve), Mrs. Allsop (deep mauve), Maggie Mott, Edina, Lingii, and Amy Barr.

Mr. F. Rich, Worcester, in the same
shows a good series of Violas and
Pansies. The flowers are wonderfully
grown, the better Violas being Master B
John Adamson, Mrs. A. Stevenson, A
Mrs. Fisher, and a good white sort,
McDonald. The Fancy Pansies repre
seedling strain of the raisers, and ther
many promising things amongst them.

At the Embankment entrance to No. 2
Mr. W. Yandell, Maidenhead, has set
charming display of Violas, mostly o
bedding varieties. We liked the follo
bedding kinds:—Lady Tennyson (w
Bridal Morn (mauve-blue), Mrs. Chich
(purple and white), Elsie (light ma
Kathleen (crimson and white fancy),
rose Dame (primrose), Gladys Finlay,
Knox, and Kitty Bell (lilac). Large-flow
kinds are well represented by Canary Q
Rebecca, Bessie Fergusson, Edith B
Moseley Perfection, and J. D. Cowan.
flowers are very fresh and clean.

ALPINE AND HARDY PLAN

The general impression of the hardy
alpine plants is that of well-grown and
tried favourites, for there are very few
plants and none of them are likely to
into instant popularity. Some plants hit
seldom seen are apparently beginning
appreciated. Silene Hookeri has succes
tempted the skill of the cultivator wit
enormous flowers of pure coral pink d
slashed in formal, Japanese fashion,
are nearly as large as the neat little c
of rosettes which carries them; it is n
easy plant, demanding, at least, a
drained scree, with a pane of glass in
winter, and is probably safer in the a
house. Erigeron leiomerus is a minute,
forming plant, suitable for scree or a
lawn, with neat flowers in clear, pi
lavender, pale and luminous. Viola
wright's Ruby is not very well named
it is a brilliant Wallflower red, a much
colour than that implied by "ruby," but
one of the most distinct of all the be
Pansies and well deserves its growing
larity.

Rhododendron calostrotum, shown
Messrs. Waterer, and Daphne tang
shown by Messrs. Bees, are two new
green shrubs for the rock garden, of w
the Rhododendron will certainly be pop
when it is better known, for it is very
pact and bears its astonishingly large
beautiful flowers very freely.

Particular attention should be given
those who are interested in rare plants, t
valleys of Messrs. Reuthe's mini
mountain range, for they contain a rem
able collection of unusual plants.
smallest Narcissus, N. juncifolius, look
though it had been designed by an illumin
of old manuscripts; the rare Tulip,
Batalini, in pale butter yellow, has,
expectedly, a powerful scent of oran
Geum triflorum, a subtle arrangement in
brownish pink and bluish green from
Zealand; Silene Hookeri, which deserve
care it demands for its relatively gig
flowers, in pure coral pink, strangely sla
and almost overshadowing its small, gr
rosettes. A large spiny clump of Erin
pungens from Spain is covered with lave
flowers, and showing itself to be a first
plant for those who have patience to wai
it to grow.

Messrs. Ingwersen's garden of flat terr
brooded over by two gnarled old Japa

plants, though the late winter has kept
some of the best of their stock. Notewo
are the odd green Saxifrage, S. luteo-vir
which is very happily associated with a la

awn and brick pergola in Cheals' garden—Azaleas in foreground, Roses on pergola

An old world Devonshire garden with stream and stepping stones by N. I. Baggesen

Cool and refreshing: Japanese water garden by Wm. Wood & Son, Ltd.

Rhododendron impeditum between rocks in Mr. W. E. Th. Ingwersen's alpine garden

A well flowered group of Waterer's Rhododendrons

Bunyard's Pæonies—a triumph of cultural skill low mound of Armeria cæspitosa, Ranunculus millefolius, a neat, pale yellow Buttercup; and the scarce, sealing-wax red Tulipa linifolia. A small, but healthy flowering plant of Eritrichium nanum is hiding, unworthily and unnaturally, in a bed of Moss.

John Scott and Co. strike an original note and rest the eye with a green garden; an admirable idea since, after all, green is a colour—even in the garden—and this exhibit makes the most of it, using all the many tones provided by the dwarf Conifers, from almost black to old silver and dull, greenish gold. It is lit up by a few touches of pink and blue in Lithospermum and Phlox, so that the effect, though restful, is anything but sombre.

Messrs. Gavin Jones crown the mountain spur of their exhibit with a sombre centenarian specimen of Pinus Thunbergii, which throws its shadow over a glittering carpet of good and rare plants: Viola megaceras, a fine, purple-violet from Tiflis; Gypsophila aretoides, which makes a tight cushion almost like one of the high alpine Androsaces; an extra pink form of Antennaria dioica rosea; Phyteuma Halleri; the dainty little Iris lacustris, the smallest of its race; and many others. Altogether a beautiful as well as an interesting exhibit.

Messrs. Cheal and Sons show a large clump of a particularly fine, deep-coloured form of Gentiana acaulis, which recalls Farrer's description of it as a "patch of midnight summer sky"; the sweet-scented Alpine Clover, Trifolium alpinum; Lewisia Howelli; and Iris christata.

The Marsden Hardy Plant Nursery make a bright show, under a Japanese Maple, of good, sound, and showy plants; Viola Arkwright's Ruby, now coming into deserved popularity; the uniquely coloured Viola, Apricot; Daphne Cneorum; Hypericum Colbyanum; and an interesting, very compact, and mossy dwarf Conifer, Retinosporum nana compressa.

Maxwell and Beale's exhibit blazes up with dwarf Azaleas and tones quietly down into the soft shades of Mossy Phloxes, Campanula Steveni nana, and the subtly-coloured Wood Sorrel, Oxalis Dippei, in its almost indescribable shade of faintly brownish old rose. The exhibit contains a good group of Primula vittata and P. secundiflora.

Messrs. Whitelegg's exhibit is brilliant, with sweeps of Daphne Cneorum, Phlox, and Mossy Saxifrages.

Messrs. Wells, Junior, make a fine, bold group by covering a miniature mountainside with Lithospermum Heavenly Blue, Veronica Hulkeana, a particularly fine and flowery patch of Gentiana verna, Potentilla fragiformis, Dianthus Alpinus, and Pentstemon Davidsonii, flanked with sombre outposts of the gigantic Sempervivum Comollei.

Messrs. Bees have a triangular bed of rich colour, of which the leading motive is supplied by the orange of Trollius, a fine strain of Polyanthus, and the new Geums Fire Opal and Dolly North. Besides these brilliances there is the distinguished newcomer, Daphne tangutica, a vigorous evergreen with sweetly-scented flowers in very pale lilac, with a deep, purple reverse, Roscoea cautlioides, originally introduced to gardens by this firm, which stands alone in the softly luminous quality of its pure, pale yellow, and the superb crimson and gold of Pæonia tenuifolia, which is far too seldom seen in gardens.

The neighbouring bed of Messrs. Wilson and Agar is delicate with the dawn colours of Lupins and pale Delphiniums; a very beautiful and thoughtfully arranged exhibit.

Maurice Prichard and Sons have blended some pale yellow and coppery coloured Mulleins with Lupins and Japanese Maples, and they show a fine hybrid of Pæonia officinalis, which looks like a great crimson Water Lily.

Messrs. Clarence Elliott's finely designed mountain range encloses a series of Alpine lawns studded with some of the good plants of which the firm has made a speciality—the delicate bells of Sisyrynchium filifolium and Oxalis enneaphylla rosea from the Falklands; the hybrid Primulas, the General, Eileen, and Argus. The higher slopes are crowned with Juniperus compressa nana and little gnarled trees of Daphne rupestris.

Messrs. Prichard, of Christchurch, show some very fine and well-grown plants in a glittering mosaic, in which a remarkably good specimen of Silene Hookeri stands out superbly; the iridescent Lithospermum intermedium; Cortusa pubens; Viola pedata and its bicolor form, Wahlenbergia serpyllifolia; two beautiful albinos, Ramondia pyrenaica alba and Haberlea virginalis.

Messrs. Harkness and Sons show the uncommon double orange scarlet Nasturtium, Hermann Gaesoff, blazing out among golden Trollius and Iceland Poppies.

Mr. Kirch exhibits well-grown pans of Androsace cylindrica, Eritrichium nanum (in flower and looking very healthy), and some florists' Auriculas.

Messrs. Tuckers' indoor rock garden, crowned with Meconopsis Baileyi and M. integrifolia, is particularly interesting for its rather subtle display of soft and delicate colours. Asperula suberosa is shown in a broad drift of pearl-pink and silver, shading into the delicate lavender of Polemonium repens; two good and rather uncommon plants, Geranium Farreri, with large blossoms of clear, pale pink and black anthers and Mertensia echioides, with glowing croziers of violet blue, are given a full opportunity of showing their distinction.

Wm. Wood and Son (Taplow) have a very decorative collection, in which the brilliant, strong blue of Omphalodes cappadocica combines effectively with the pale yellow of Anemone Magellanica and the delicate lavender of Pentstemon Bridgesi.

Kent Brydon and Haigh show the now rare Primula sino-plantaginea; Uvularia grandiflora, looking like a small Solomon's Seal hung with large, pale yellow bells; and Rubus arcticus, which is not often seen in gardens, though it makes an excellent ground-cover for dwarf Rhododendrons.

Mrs. Milford makes a miniature garden, containing the dwarf grey Willow Salix lanata Stuartii, which is beginning to be appreciated as it deserves in rock gardens; and the intensely sweet Columbine Aquilegia viriflora, strange and beautiful in green and black.

Messrs. G. Zambra show a collection of Violas, including Windward Sensation, a neat lavender seedling; Windward Purple, large and dusky; and a bright bedding Viola, Windward Amethyst, all raised by the firm.

L. Langridge and Co. have a little rock pool surrounded by Mossy Saxifrages, and the delicate, wavering stems of Primula chrysopa, overhung by Linum arboreum.

W. H. Rogers and Son have a fine, large patch of the minute Pink Dianthus Rumelicus and Iris christata, with a clump of Iris gracilipes hung with its delicate, hovering flowers; and a double cluster-headed Pink in a curious tone of dull cerise.

Messrs. Bowell and Skarrett have, as usual, a collection that is notable for rare and interesting plants. It includes a large-flowered form of Dianthus Freynii, in the palest possible soft pink; Polygonum viviparum, a rare native with spikes of pure,
clean white; Tanakea radicans, a
little Spiræa from Japan; a hybrid b
Geum triflorum and G. rivale; the dim
parasite Lathrea clandestina; A
Dilleni atropurpurea, a soft, crimso
which is a great improvement on the
and several interesting Lewisias.

Isaac House and Son, instead of s
their Scabious, which presumably hav
held back by the weather, give us a b
a good form of Pentstemon hetero
and that very good shapely Pink
Ladies.

H. Hemsley shows the very inte
hybrid Pink Cæsar's Mantle, an
shade of soft crimson; the brilliant
crimson cluster-headed Pink Pri
Wales; and the solid, rather stocky
panula nitida alba.

Backhouse, of York, have a neat lit
den with the minute Rose, R. R
growing happily under a dwarf Coni
the Viola Arkwright's Ruby, which i
ciated with the firm.

Messrs. Casburn and Welch have
and very interesting cliff of grey rock,
shows off the quality of a fine and
flowered plant of Erinacea pungens,
tall, magnified form of Campanula
which holds its relatively enormous
bury Bells up on 3-inch stems. The
tion includes the neat little R
Phyteuma pauciflorum, which is mucl
floriferous than its name implies; a
lovely but difficult Omphalodes Luci

John Waterer, Sons, and Crisp s
very red Aubrietia Bon Fire, the W
variety of Trollius pumilus, with
waved petals; the very distinguishe
Hoogiana; and the admirable little
dendron, R. Calostrotum, with its very
long-stemmed flowers, in a soft colou
suggests Raspberries and cream.

Messrs. Baker have a brilliant
crowned with the gigantic Primula flo
and lit up by the fierce scarlet of th

PRIMULAS

and Mrs. Kemmis, of Everston Grange, nigton, have a delightful group of parly well-grown plants, interspersed with Amongst the various species and is are P. helodoxa (a tall yellow), the Strain of P. pulverulenta, P. Japonica (a rosy terra-cotta), P. Japonica les Crimson (the deepest of all the a forms), P. Littoniana (giant form), brida Mrs. Kemmis (a rose pink, white stripes, evidently of Japonica P. vittata and P. secundiflora (very , with purplish nodding flowers), P. (with better foliage than flower, is a plant for dark, shady corners), P. (the most delightful of all the family, s delicate mauve sweet-scented flowers, nealy calyces and stems), P. hybrida not unlike the hybrid Sir George y, a very good flower). P. capitata purple flowers in round heads, with iealy calyces and stems), P. bulleyana 's variety is a paler form of the ordiecies), P. Wardii (with delicate mauve), P. microdonta alpicola (yellow and let and purple forms), P. Cockburnirilliant orange), P. Asthore seedlings, rious coloured hybrids of P. Bulleyana Beesiana.

Milford, of Chedworth, in her Alpine has P. Cockburniana, P. chrysopa te mauve), a very fine plant of P. onta alpicola, P. involucrata and P. ra (mauve), P. vittata and Meconop-Bileyi, and M. Prattii, with darker blue .

rs, of Wolverhampton, are showing magnificent plants of P. Florindæ in wer, also chionantha with large heads ite flowers, Wardii (mauve) and its cousin, involucrata, Veitchii (vivid ta), Lissadell hybrid, Red Hugh, riflora, and Microdonta violacea.

Oliver Hunter group, as usual, is full iterest. Among the Primulas are ipes (a dainty form of Sikkimensis), plants of P. chionantha, the giant form ioniana (the rare white form of Gerald-)P. lepta (of the Muscarioides section), opsis cetonicifolia (Baileyi) and M. folia, Lichiangensis var. hapala, Sikis helodoxa, and Japonica forms.

Aberconway and the Hon. H. en have a magnificent group of varints. Of the Primulas they are showtere are very fine plants of atricapilla deep mauve shade in close heads), a between helodoxa and anisodora P. hybrida anisodoxa (of a coppery-shade), secundiflora aurantiaca (a orange-yellow Candelabra), chrysopa nauve), grand plants of Chionantha veral forms of the nivalis section, the pulverulenta form, Brownie, from , Meconopsis betonicifolia integrifolia), K.W. 6862 (a pale blue), quintuia with a double-flowered form, s (a big flower of very deep blue).

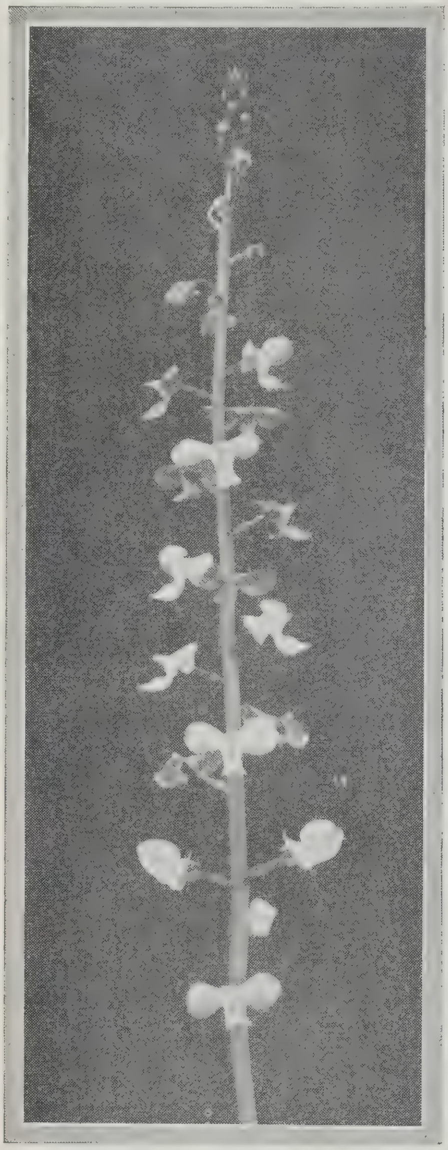
awell and Beale have in their Alpine a fine form of P. Sieboldii rubra clora. They are also showing involuta, ecundiflora, and chionantha.

es, Junr., of Merstham, have some plants of P. chrysopa and sibirica lverulenta in good form.

I. Dalrymple has a good group of mas adjoining his Lupins. The centre up of a big mass of his new hybrid, orge Thursby, a very big crimson of great constitution.

Others shown are Burmanica (purple, with yellow eye), helodoxa, vittata, involucrata (the lovely nutans, with sweet-scented, pale mauve flowers), microdonta alpicola and its forms, the Bartley forms of pulverulenta (of which Brownie is a new one), Forrestii capitata, Cockburniana, Bulleyana, and Ward's paler form of this series, chionantha, and the dwarf heucherifolia (with deep purplish-crimson flowers), Japonica Miller's Crimson, and Florindæ (though not in flower, is effective as a foliage plant).

P. Gardner, Addingham, have P. farinosa, the Bird's-Eye Primrose, Meconopsis quintuplinervia, the mauve Harebell Poppywort.



A rare Orchid of botanical interest—Lissochilis speciosus — shown by Mr. W. R. Lysaght

Ladhams, of Shirley, Southampton, have big masses of P. Sieboldii grandiflora and the hybrid La Lorraine (a deeper colour). Both these appear as if they might be tender, but they are quite hardy.

ORCHIDS

A tent is devoted to Orchids, and it is well filled with finely-grown plants, all sections being more or less represented. With one or two exceptions the staging is of the stereotyped style, viz., a bank sloping from the back to the front. This, however, if not too extended, gives the exhibitor an opportunity to show off his plants to advantage.

At the far end Messrs. Charlesworth, Haywards Heath, have a fine display, in which Odontoglossum are much in evidence, and it is pleasing to observe the very fine forms of the white type of O. crispum. A grouplet of O. Toreador varieties is also to be seen; these have flowers with a white ground, spotted more or less with red. Among the fine spotted Odontoglossums are Muralis, Colonius, Hercules, Endora, and Nubia (a very fine thing). Miltonias are there; also the yellow Brassocatlælia Africa, and the white Odontonia Thisbe.

The leading feature in the fine group staged by Messrs. Sanders, St. Albans, are the glorious Cymbidiums. Many grand specimens are on view; especially good are C. Ceres. Other hybrids are strongly in evidence, and several of the less showy species. Arranged on high pedestals are healthy plants of the white Phalænopsis Rimestadiana, which are most effective, and in pleasing contrast to other highly-coloured Orchids.

This firm also have a wonderful array of Miltonias and Lælio-Cattleyas; also some fine varieties of Cattleya Mendeli. Interesting and beautiful is Cœlogyne Lawrenceana, a rare and choice plant, with pale yellow sepals and petals with white lip and orange-red base, scarlet Odontiodas, the greenish-white Cypripedium Maudiæ, and the brilliant Brasso-Cattleya Shilliana are only a few of the many treasures to be seen in one of the best-arranged groups in the show.

H. G. Alexander, Ltd., Tetbury, Glos., fully maintain the Westonbirt tradition by displaying well-grown examples of high quality. Here can be seen good forms of Cattleva Mossiæ, the magnificent Brassocatlælia Ajax, with large mauve flowers and massive lips, which contains a yellow base.

Lælio-Cattleya Orange Gems are rather small but showy, and there are many good forms of Catt. Skinneri. Noteworthy are Cymbidium Joan Sander, the white Catt. Undine, and Lælio-Cattleya Imperatrix regina. Altogether a bright and effective group.

Quite unique is the small display of specimens of Dendrobiums put up by E. R. Ashton, Esq. (gardener, Mr. Kent). They embrace white D. nobile, the yellow D. Thwaitsii and Cooksonæ, and a pair of the rare D. atroviolacum, with its violet and green flowers. All bear evidence of good culture.

Messrs. S. Low, Enfield, have a nice and varied group, in which we see the rare yellow Cyrtopodium Andersonii in close proximity to Odontioda Saturn, a rich dark, port wine coloured variety. Cœlogyne Burfordense and the rich yellow L.-C. G. S. Ball is also noticeable, while the group is rich in Cattleyas and its allies, especially the dark L.-C. Hyenna. Another fine subject is Brasso-Cattleya Highlander, with its huge fringed mauve lips, with a yellow throat. The rose-coloured Sophro Catt. Joan is also in evidence.

Messrs. McBean place good examples of Dendrobium acuminatum in the centre of their fine group. Another choice and well-grown plant is the scarlet Epipronitis Veitchii. Many Miltonias are arranged to the best advantage, and these embrace Princess Elizabeth, G. D. Owen, the beautiful Charlesworthii, and the chaste white Bleuana virginalis. White Cattleyas are well to the fore, and Odontiodas in various shades of red are also strongly represented. Excellent varieties of Odontoglossum and the blue Dendrobium Victoria Regina are also on view. A group of more than average merit.

Sir J. Colman (gardener, Mr. Perfect) has a choice display which contains many plants unique in many respects. The grand varieties of Lycaste Skinneri are an exhibit in themselves, while the Miltonias occupy a high position in regard to quality. Several quaint Bulbophyllums, especially B. macrobulbum can be seen in this interesting group.

Linochilus speciosus is sent by W. R. Lysaght, Esq., Castleford, Chepstow (gardener, T. W. Briscoe). It has a strong single spike, bearing numerous yellow flowers 2 inches across. This plant attracts attention because it is rarely seen in cultivation.

J. J. Joicey, Esq., Witley (gardener, Mr. Mackay), has entered a group for the Challenge Cup. It contains many plants of more than average interest.

Mr. D. Dixon has a varied and pretty exhibit, in which we noted Dendrobium atroviolacum, the quaint Cymbidium Devonianum, and the greenish C. tigrinum. A fine form of Lycaste Skinneri, aptly named Rosy Gem, while the vermilion-scarlet Masdevallia Veitchiana adds a touch of gorgeous colour to the whole. Other seasonable Orchids are exhibited.

Cowan and Co., Southgate, arrange a well-displayed group of useful and choice plants, among which are the beautiful Odontioda Czarina var. Brilliant, a salmon shade, which is fairly new to the genus. Maxillaria Sanderiana is in fine form with its whitish flowers marked with light chocolate, and the green Cyp. Maudiæ is much in evidence. Miltonias are bright, and among them are several fine varieties. White Cattleya Waltersiana splendens is a richly-coloured Orchid of the first water.

Sutton Bros., Hassocks, Surrey, have a small group which contains seasonable plants such as Miltonias, Cymbidiums, and Odontiodas.

Armstrong and Brown, Tunbridge Wells, are represented by a small, but very choice group. Each plant is well displayed, and of first-rate quality. Miltonias are especially strong, and noteworthy is the beautiful M. Armstrongii. Odontioda Henryi scarlet and the dark O. Charlesworthii are also seen in fine condition.

Mansell and Hatcher, Rawden, Yorks.—In their excellent group the centre consists largely of Miltonias such as F. M. Ogilvie, with its large, central maroon blotch, and others of equal merit, and beneath the Miltonias nestle Cypripedium bellatulum, with their waxy, dark-spotted flowers. Masdevallia Houtteana is well flowered, and this remark applies to the quaint Selenepedium Mæwchilum, with its long tapering petals. Lycaste aromatica and many other seasonable plants are in this group.

The charming exhibit by Messrs. Black and Flory, Slough, is conspicuous for its brightness, and this is brought about by the numerous fine, highly-coloured Cattleyas and Lælio-Cattleyas it contains. Many of these are derived from a good variety of Catt. Tityus, and Catt. Canada in variety belongs to this group. A fine thing is C. Chelsea, and there are grand examples of Miltonia.

**lia clusiana (My Lady Tulip) natur-
aled in the Mediterranean region**

How bulbs burrow

ring from California Carol Purdy : ' Such bulbs as those of the Tulip esily adjust themselves by going to a r epth in the soil if they are planted too o. For instance, if a bulb of Calo-tu were planted with barely enough soil or it, a white spongy ' stem-root ' de sent down and the new bulb would rmed at its end. The next year, if it ill too near the surface, it would go deeper. Yet, when bulbs are planted too hey cannot ascend.

lips very frequently send down bulbs h the Dutch call ' droppers.' I once a ed of the rare Tulipa Eichleri, and n summer I went to dig them they e gone. Next spring the full number es came up where I had planted the s, which I found had dropped to about cs.

Th bulbs of true Liliums also can ad-themselves, but not in just the same way. n these a shorter spongy ' stem-root ' rs the growing point of the bulb and the e forms a few inches lower. Since ol scales of a Lily bulb decay very ly it may be a few years before the e ulb is at the lower level.

In one very interesting instance Nature ts ' dropper ' habit to distribute bulb-me widely in the ground. Calochortus us estæ has several bulblets set at angles the stem below the ground. At the end he eason the stem above the mother bulb al each offset sends out a ' dropper,' dom but sidewise. These may move ra inches the first season and each in a ere direction. The second year they urther away and then become erect, re they stay to finish their natural life."

or ulture, U.S.A.

Tulip species

The brilliant varieties of bedding Tulips, the glorious Darwins, and others of this august race are well known and appreciated, and are planted in countless numbers every season: the species—of which there are about 50, inhabiting the Old World, more especially the Steppes of Central Asia—are, unfortunately, not to be found in every bulb catalogue; but perhaps those mentioned below, although not by any means a complete list, may serve as an indication of the great variety of beauty in the genus

THE genus Tulipa varies immensely, from dainty dwarfs suitable for the rock garden to blazing scarlet furnaces, on sturdy stems, so bright and splendid as to be almost painful to the eye when fully open in the sun. The leaves vary greatly, too; some are large, upstanding, and brightly glaucous; some are flaccid and dark green, but those of the majority of smaller species are very narrow, induplicately folded, with more or less wavy edges. Often a narrow line of dull red may be noticed round the very edge of the leaves.

The order of description is roughly that in which they open, but, of course, the times are dependent upon the season. This year they are particularly late.

The first to open is the dainty T. biflora, from the Caucasus; it may generally be expected toward the end of February. T. biflora has flowers of creamy white with yellow centres, tinged on the outside with greeny blue. Its relative T. turkestanica is more robust and has a smaller yellow centre to the creamy flowers.

A little later comes the well-known T. kaufmanniana, its upstanding, starry flowers of creamy white, with bright yellow centres, contrasting well with the soft glaucous green of the leaves. It is even more beautiful when closed, as the outer petals are flushed with pink or scarlet, or they may be tinted with grey-blue. That it is a very variable species may be testified still more by the variety Brilliant, which has flowers of a soft shade of salmon scarlet, with a brighter centre. The type is a native of Russian Turkestan.

It is soon after these have opened that the main mass of Tulip species launch out their fullest beauty—about the middle of April. T. præcox, from South Europe, is one of the tallest; stout brownish stems above large glaucous leaves carry a burden of peculiarly angular appearance, scarlet, with a black centre, softened outside by a creamy "bloom." A native of Bokhara, T. præstans, has roughly-glaucous leaves, with a distinct midrib, and branching stems with two or three light orange scarlet flowers; from Turkestan comes gorgeous T. greigi, of

A striking group of Tulipa saxatilis in the Botanic Gardens, Cambridge

blazing scarlet, the outer petals curving gracefully outwards from the bold, upright inner ones. Its leaves are characteristically striped and blotched with maroon, a distinction shared by its variety aurea, of deep gold and crimson. Even larger is T. Eichleri—a native of South Caucasian regions—of crimson scarlet, refreshed with clear cream outside, and with a yellow centre outlined with black; and then there is magnificent T. fosteriana, from Bokhara, the giant of all, with its enormous glaucous leaves and brilliant, dazzling scarlet, yellow-centred orbs.

For the rock garden there is the exquisite T. stellata, a dainty plant from the far-away Himalayas, with narrow, crinkled leaves and starry flowers of yellow with crimson flushes outside. T. Maximowiczii and T. linifolia are best described together, the only apparent difference being in the leaves, those of Maximowiczii being narrow, more or less straight, and able to stand by themselves, whereas those of linifolia lie close to the ground and are beautifully waved. Both have flowers of brightest crimson-scarlet, with a small black centre. They are natives of Eastern Bokhara and Central Asia respectively. A similar plant is T. Hageri, with narrow leaves and scarlet flowers tinged with green outside. It is a native of Attica, and flowers a week or more later than the two preceding species. T. Batalinii has united with linifolia and given some most beautiful hybrids, which vary in colour from the brilliant scarlet-crimson of linifolia through delightful intermediate shades of orange, salmon, and cream-pink, to the soft, pale butter-yellow of Batalinii. The leaves of the latter are extremely waved and crinkled—perhaps more so than any other species—and of a pale, glaucous green. Native of Asia Minor.

Tulipa Eichleri

Flowers deep scarlet. One of the finest Tulips from Turkestan

Far away from all this brilliant company must be placed the Lady Tulip, T. clusiana, now becoming rare in its adopted home of the Riviera—it is a native of Central Asia and North-West India. It is a plant eminently suited for the rock garden; above the narrow, straight leaves of dull, glaucous green stand the pointed buds, with a soft, crimson flush down each outer segment. Then comes the sun, and lo! a star of clearest white develops with a rich wine-purple zone in the centre.

T. dasystemon is a green-leaved species from Turkestan, very dwarf, with clusters of flowers of starry whiteness and large, yellow centres. Delicacy is again met in the Persian species T. polychroma, of soft lilac tinged with cream and olive green, the flower being almost like a Colchicum on its naked stem of 2 inches or 3 inches above the narrow leaves. T. pulchella—from the Cilician Taurus—has almost stemless flowers of richest madder crimson, with a dull white centre; in some forms the colour is a brilliant pink.

A Grecian species, T. orphanidea, may be expected a week or so later than the main mass. A good combination may be made by interplanting with T. silvestris, a reputed native of this country, whose graceful, drooping flowers of bright yellow, tinged with green, are similar in shape to those of orphanidea, but in the latter species they range from pale orange to rich mahogany crimson, all the forms being more or less tinged and veined with olive-green outside.

T. saxatilis has broad, shining, dark green leaves and glorious flowers of lilac, with a large, golden yellow area in the centre, giving a very startling effect. Native of Crete. T. ingens is of richest dark scarlet with a magnificent black base and glaucous leaves. It is a fairly tall Turkestan species.

By the third week in May most of these glories are over. Generally the latest to flower are T. montana, T. armena, and, last of all, T. sprengeri. The first two are deep crimson scarlet in colour; T. sprengeri is also scarlet, but of a lighter shade, with a soft brownish centre outlined in yellow.

It must be admitted that Tulip species require a little care and forethought in planting; but when good bulbs have been acquired, and their essential ripening is
understood, a great stride has been
toward successful cultivation. Perfect
age must always be ensured; especially
bulbs are to be left permanently
ground. The most suitable place to
them is on a bank of rich, light soil
sun, under the wing of some eve
shrub, which will help to absorb s
moisture in late summer and give pro
from frosts in spring. The base of a
wall—still better if it be the wall of a
house—is also an excellent place.

If, however, the bulbs are to be lifted
year and replanted, they should be sto
a dry place in sand until November,
they may be planted from 4 inches to 6
deep, according to the size of the bulb.
out doubt, this is the best way of growi
majority successfully, especially in
soils, as advantage may be taken to
their numbers and condition. It sho
borne in mind that mice are very fond
bulbs.

Most of them produce an abunda
seed which will flower from four to five
after sowing; all may be increased gra
by division, many species being pro
"droppers" (*i.e.*, small bulbs which
deep into the soil), such as T. præcox
some assist propagation by means of st
which may travel 6 inches before deve
into a baby bulb. G. S. Tho

Cambridge.

The Book of the Tulip*

At last we have the long-looked-for
on Tulips, and we have no hesitation i
ing that it is just what was wanted. It
fact, an example of what a good bo
Tulips should be. Not that all the
problems are solved, some of them nev
be. In this book the author, Sir
Hall, appeals to residents and travell
the Near East, Asiatic Turkey, Syria,
Persia, Turkestan, etc., for bulbs or
as the real history and affinities of the s
of Tulipa are still obscure and must r
so until much more collecting and e
mental work has been done. This adm
book brings together the main facts th
known about the Tulip, from the po
view of the gardener or lover of flower
desires to learn more of the scientific, a
as the cultural aspects of the flower.
species are described from the living
mens in the garden of the John
Horticultural Institution, and in most
derived from the collection of the lat
W. R. Dykes.

Tulip varieties, as well as species, p
astounding problems, and the chapt
"Breaking and other Sports," on
subject the author is the recognised a
ity, is dealt with in a most entert
manner. Another fascinating chap
devoted to the "History of the G
Tulip." The length of time a Tulip
asexually propagated is, we are told,
tain, and an example is given in K
kroon, the well-known red and yellow
Tulip, described in the Dutch catalogue
century and a half ago, which still sho
lack of vigour. We recommend read
get this book, to read it, and digest it a
leisure. It is impossible to do justice
work in a brief review or to speak too
of it; the text has been most carefull
pared, and there is an index of specie
varieties as well as a good general
It is a work to which constant referen
be made, filling, as it does, a lo
want; it is sure of a warm welcome
who cherish and cultivate the Tulip.

full-page plates.

Ten-week Stock

ks are deservedly favourite flowers in or small gardens, and we may enjoy over a very long period if we make the of the best varieties from the several ns into which they are divided. They ost easily grown, and only need a rich, soil in order to develop full and fine s.

strains of Ten-week varieties are ex- gly numerous, and represent the result at improvements made in comparatively years. There are strains selected for ness, others because of the dense, idal habit, others for their free, ing character, the side branches of the es forming this strain being most use- r cutting. A very pretty little Stock known under the name of Purity, it specially adapted for pot culture, as by l of a little warmth it can, in pots, be cly grown to flowering size long before tdoor Stocks are showing signs of It never grows more than 9 inches ght, but its flowers are large and , of the purest whiteness, and very ey scented. Three or four plants in a or 6-inch pot in spring are charming earance, and suffice to scent a green- s or a room. No other variety that I of comes into bloom so early. A pure- it Stock that is very effective and most for cutting is one known under the of Princess Alice. This makes a ful group in the bed or border, and it moderately tall, free-branching habit. Beauty is a kind selected from the idal strain, and is quite a distinct and beautiful Stock. When planted out it d rather close planting, owing to its habit, but the colour of the flowers is nique, being of a delicate mauve tint. in known as Bedding Stocks is one of t value, because the kinds have been d in clear, distinct colours, and the of the plant is good, being free and ing without growing too tall, as the es in this strain do not exceed 1 foot ght. Where masses of particular s are desired this strain is the very one w. The selection has been so careful ery plant comes true to its colour, and rcentage of double flowers is very This strain can be had in nearly a distinct shades of colour, and if one rew these one would get a good idea amazing variety and exceeding found among Stocks of the Ten-week lone. Then there are the Wallflower- varieties again selected, and obtain- clear, distinct colours, the particular of the strain being the Wallflower- aves its varieties produce—of a deep, glossy-green colour, and a charming t to the foliage of other kinds. It l be a pity, however, if, with all the riety above alluded to, the other types ains were neglected, because the Ten- k varieties are essentially summer , and although their season may be ged by early and late sowing, yet it to pay attention to kinds that come oom at other seasons, especially those as Intermediate Stocks. These are nal bloomers, and follow close upon n-week varieties. They are remarkable dense growth that they make as they into bushes, producing a large num- of free-flowering side-shoots. C. P.

Mentha Requieni

redly amongst the most delightfully t gems of our gardens is the modest entha Requieni, a minute plant which with Lichen-like closeness and forms y green carpet with its small leaves surmounted in summer with purple labiate flowers. In spite of its miniature stature, it is well able to maintain its position, and whether planted amongst stone in the rock garden, in the interstices of paved paths, to form a carpet for small bulbs, or even in some positions among the grass of the lawn, it spreads with remarkable persistency. Its peculiar charm of fragrance is a partially hidden one, as it is not until it is touched or trodden on that its delicious peppermint odour becomes strongly noticeable. A perennial plant, it is perfectly hardy, and once established in the garden it is seldom lost, as not only does it spread naturally from the planted root stock but it also seeds freely and perpetuates itself by this method.

W. AUTON.

An artistic flower pot

In the centre of the sunk garden at Walmsgate Hall, on the wolds of Lincolnshire, an Italian well-head stands in the midst of a small Water Lily pond, and forms a gigantic vase for a well-flowered Hydrangea. It gives a note of distinction to the whole garden, and is worthy of imitation, even by those who are unable to obtain so priceless a treasure as a well-head from sunny Italy.

The next best thing is a large, well-bound tub, painted with two or three coats of enamel paint, of a suitable colour, which can only be determined according to the situation and surroundings of the tub. In most cases a good green will be appropriate. It is desirable, however, that the tub should be raised on a stone platform, as in the Walmsgate example. It would make a garden ornament of which any gardener may well be proud.

This Hydrangea in an ancient well-head makes an effective centrepiece in a sunk garden

Primula viscosa var. Mrs. J. H. Wilson

This is one of the neatest and prettiest of the dwarf Primulas, the rosy flowers appearing in spring on slender stems only 2 inches high. The flowers are arranged in a loose cluster consisting of many individual flowers in various stages. For density of bloom it approaches the Auricula, but rarely equals it, while it has the advantage of being suitable for planting sideways in sunny chinks and thriving in sandy loam.

When planted on the level so as to form clumps, the plants have a charming effect. A few bits of rock placed among the plants if they are planted in groups or tufts will do good by preventing evaporation, and also act as a protection to the plant, which never outgrows its position. It may be grown well on fully exposed spots on the rock garden which is kept well moistened during the warm season. In common with its congeners, the plant is liable to become crowded and lanky, therefore a top-dressing of sandy loam is necessary once a year. It is easily propagated by side shoots or seeds under glass.

H. STEVENS.

Arranging cut flowers

In the course of an article by Elizabeth Riley in *Horticulture*, recently, some interesting comments were made on the art of cut-flower arrangement. The following rules, with which the article ended, were emphasised by the writer :—

" One—Choose receptacles with care. Pay due regard to size and colour. Undecorated ones are safest. Remember that heavy-headed, long-stemmed flowers demand tall generous vases, while the smaller tender-faced blossoms are satisfied with low, flat bowls."

" Two—Do not crowd your flowers. A few will go far if properly adapted to their environment. A glorious bouquet of garden flowers is often wasted when crammed into one huge jar. Distribute their sweetness through several rooms. Even when your garden is most prolific use your blossoms sparingly."

" Three—Separate your flowers. Keep certain varieties together (with rare exceptions), mixing the colours only when you are sure of harmonious blending. It is true that Nature's colours never clash, but artistic placing will increase their value."

Lupins from seed

Few plants contribute so much to the beauty of the spring garden as the Lupin. There are many kinds in cultivation, both annual and perennial, but the most important, at any rate from a garden point of view, are the hybrid perennials. When well placed in gardens the effect is superb, their profusion of bloom creating a fine mass of colour when most needed.

New varieties are rather expensive, but the keen lover of these plants will find no more interesting phase in their cultivation than the raising of an army of young plants from seeds. Not only can a vast number of plants be thus secured easily and quickly, but frequently they possess greater vigour and produce larger flower-spikes than those secured by the system of division. With the extra vigour that they possess these seedlings are better adapted for resisting the ravages of insect pests. Plants are easily raised from seed sown in boxes of light soil under cover of a hand-light, or in the open ground during May and June. When it is intended to adopt the method of sowing out of doors a bed should be prepared in some open spot where the plants can from the outset develop to the full a sturdy, robust specimen. If the soil is light no other preparation will be necessary beyond digging it deeply and breaking up the large lumps, but, on the other hand, if the soil is of a heavy nature, leaf-soil and sand should be dug in to make up a congenial rooting medium. Tread the whole moderately firm and draw drills about 10 inches apart and about ½ inch deep. Sow the seed thinly, just covering it with fine soil. When the seedlings are just coming through dust freely with lime to guard against the plundering slug.

The resultant plants may remain in the seed-bed until large enough for planting in their flowering quarters, or may be pricked out into rows in the open ground.

Seedlings usually flower the second year after sowing, but this is entirely determined by the health and vigour of the specimen.

H. Stevens.

White Dahlia and Japan Anemone

Bedding Violas

Violas are just the plants for amateurs. They are easy to grow, always do well except in a very hot season, and bloom throughout the summer and autumn. Plants in the border that have been left undisturbed are now nicely in flower, and, as these are in their second season, they will continue to do well.

Older plants should have been divided last month, but it is not too late if done at once. Cut the plants into portions, each with a bit of root, and they will soon make strong plants and produce large blooms. Rooted cuttings of all the best varieties may be purchased at a reasonable rate, and if cuttings are taken from these in autumn ther
be plenty of plants for next year.

The soil for violas must be deeply du

Modern yellow Chrysanthemums com

Dahlias yellow and warm white

White Star Dahlias

grup of many varying shades of colour. e very useful and attractive variety is ffil, claimed to be the equal of indoor ves so far as substance and finish are cned. Given good cultivation, this is taly no exaggeration, and the free and y abit of the plant classifies it as one ic serves a useful purpose whether grown ntural sprays or disbudded blooms.

rdom of growth also characterises d Dame, which, as it name implies, is a p golden yellow or flame colour. This ie is a seedling from Pink Delight and f milar habit. One important difference, ver, is the fact that Gold Dame commnces to bloom in August, a month or so lie than the parent variety. It is an exler all-round plant and suitable for all ris.

Ir James Scalley is a fine variety to grow secimen flowers. The plant attains a g of 3 feet and bears flowers of a pose-pink, the reverse of the petals be- sver. Grown as a bush it furnishes an nance of flowers, but is, perhaps, rather e in some localities, and hence preference gin to limiting the number of blooms orer to induce earliness. The lightness evn the larger blooms makes them very ef for decorative purposes. If slight protic can be given in unfavourable weather tal results are quite good; the plant is very suitable for transferring from the n o bloom in a cold greenhouse.

Anher pink flower of attractive shade is k which is also different from the preiin variety in the general build of the we Towards the centre the petals have irng tendencies, while the outer ones rlexed. The plant forms a good bush mmences to flower mid-way through ptember. If disbudded it gives full, deep wes carried on long, firm stems.

Alrante is a flower which has been popr r a number of years, but, unfortunateit ften proves too late to be relied upon ery year by many growers resident in stris which are subject to early frosts. is ifficulty has now been overcome, however, by the introduction of Glow. The we of this variety resemble those of the older favourite in colour, crimson with golden tips, but in other respects it is superior. The disbudded blooms are larger and ready for cutting fully a month before Almirante starts to bloom. Other good qualities are the fine build of the flower, the texture of the petal, and the length of stem in the case of both disbudded blooms and natural sprays.

As a deep and rich crimson self, Crimson Circle stands alone. The plant grows to a height of 3 feet, and the blooming period is from mid-August onwards. The sun does not exert any harmful influence on the richness of the colouring, and even after heavy rain the flowers look none the worse. It may be interesting to note in passing that Robin, one of this year's introductions, is a seedling from Crimson Circle, and if it possesses the qualities of the parent plant it should prove an asset, as it commences to flower towards the end of July.

Salmon Queen is a splendid variety for September blooming, suitable either for disbudding or growing in sprays. When limited to six or nine blooms per plant the flowers are extra large and full, and furnished with long pliable stems. The colour is a pleasing shade of salmon-bronze, entirely distinct from that of any other variety. Last year this particular variety was very fine in the border, and a number of later plants transferred to a cold house continued to provide excellent blooms until early November.

Bearing in mind these days when colour among flowers constitutes a subject of controversy, the Chrysanthemum grower is perhaps apt to transgress in connection with the purple flowers. The difficulty is that this word does not do full justice to some of the exquisite shades which are to be found among this class of flower. The only means of attaining an idea of the true colour is by actually seeing the flower. Purple Robe is a seedling from the popular Lichfield Purple, but is much lighter in colour and in several ways an improvement on the older variety. The rather difficult habit of the latter is entirely absent in Purple Robe, which makes a neat and compact bush of from 2½ feet to 3 feet high.

Jack Robbins is a flower of beautiful form and good size, borne on a bush of fine and vigorous habit. The colour is a clear shade of amber, and whether grown naturally or for disbudded blooms, the plant gives entire satisfaction. Where Bronze Early Buttercup has met with favour, this variety will also prove acceptable. It grows with the same freedom, commencing to bloom about the same time and continues to send up flowering-stems until cut down by frost.

Mrs. Phil Page is included in the list for several reasons. In the first place, like its parent plant, Mrs. Jack Pearson, it is amongst the earliest to bloom and therefore suitable for all districts. Again, to use a gardener's expression, it is a very easy doer, and gives either good-sized disbudded blooms or natural sprays on long stems. Furthermore, the colour, a shade of red-bronze, is one which seems to meet with general approval. A system of treatment to which the plant readily responds consists of two stoppings, after which the plant develops long stems which may be limited to one bloom each, or allowed to produce sprays according to individual taste.

A. E. Wright.

Lochend, Neasham Road,
Darlington.

Aster grandiflorus

Although this perennial Aster is as hardy as other members of this family, it has never been, in the true sense of the word, a popular garden flower. It is not sufficiently robust to thrive under rough-and-ready treatment, and, in my experience, is apt to suffer much in periods of very dry, hot weather. It needs a certain amount of culture, and is worth it. Those who need rather large plants for autumn decoration would find this Aster very useful. One way of growing it, is to put good-sized pieces in 8-in. pots in rather rich soil and care for them in the usual manner. An easier way is to plant out in good soil and pot the plants in September, putting them under cover in October, when they are potted. J. Cornhill.

Answers to Queries

Queries—*Queries and answers are inserted in* GARDENING ILLUSTRATED *free of charge if correspondents follow these rules: All communications should be clearly written on one side of the paper only, and addressed to the* EDITOR *of* GARDENING ILLUSTRATED, *Bouverie House, Fleet Street, London, E.C. 4. Letters on business should be sent to the* PUBLISHER. *The name and address of the sender are required in addition to any designation he may desire to be used in the paper. When more than one query is sent, each should be on a separate piece of paper; the name and address being added to each. As* GARDENING ILLUSTRATED *has to be sent to press some days in advance of date, queries cannot always be replied to in the issue immediately following their receipt. We do not reply to queries by post.*

Naming plants—*Readers who wish plants to be named should send fair examples of each—the stem, leaf, flower, or fruit. (Snippets of leaves and points of shoots are useless.) Not more than four plants should be sent in any one week by the same correspondent. Where more than one kind is sent they should be numbered. Of conifers the cones should always be sent.*

FLOWER GARDEN

Tulipa sylvestris

Many years ago I brought home some bulbs of Tulipa sylvestris from Italy, and for a long time it bloomed freely and became a large patch in my rock garden. For the last few springs there has been no bloom, only abundant foliage. Do you advise lifting and dividing its roots, which have a peculiarity of growth and self-propagation? I read that this Tulip is a native, but have never met with it in England. ELLEN E. STEVENSON.

[We advise you to lift and divide your Tulip bulbs, which have impoverished the soil, and after selecting the best of the bulbs transplant them in fresh and well-prepared soil, and preferably in a different position. They will most probably flower again in two years' time. The trouble you speak of is quite characteristic of this species. Tulipa sylvestris is considered by some botanists to be a distinct species, by others to have been distributed by man. It grows wild in the south of France and other countries in the south of Europe, and is found also in a wild state in chalk pits in England. You should read the history of Tulipa sylvestris in the recently published Book of the Tulip, by Sir A. Daniel Hall, published by Martin Hopkinson. (See review page 370.)]

Taking up and storing early Tulips

(E. W.).—If dug up carefully and immediately "heeled" in in the reserve garden, given some water, and afforded a little shade for a week or so, the bulbs will suffer but little. As soon as the foliage has died down lift the bulbs, lay in shallow boxes, and set in a dry, airy place until quite dry. The stems will part easily and the bulbs can then be placed in baskets, or other receptacles, and hung up in a cool shed until planting time. If the site is changed annually, the bulbs will continue to increase indefinitely, and if only the largest and soundest are planted good results will continue.

Plants for a granite trough sunk in a pond

(M. J. B.).—The following would thrive there:—Myosotis palustris semperflorens, Caltha Tyermanni, C. polypetala, Primulas rosea, pulverulenta, and helodoxa, Cyperus longus, Rodgersia podophylla, Spiræas Aruncus, S. palmata, Saxifraga peltata, the Bog Bean (Menyanthes trifoliata), Mimulus in variety, Trollius europeus Orange Princess, T. Lemon Queen, Tradescantia virginica, and Parochetus communis around the edge.

Raising Meconopsis from seed

(Sylvania).—The seed should be sown in pots or pans, well drained, and filled with light soil as soon as it is ripe, or by the end of August, at least. Cold frames are very suitable for the purpose, but it is advisable to cover the pans with a slate or similar object to prevent evaporation until the seeds have germinated, when they must be gradually exposed to light and sunshine. It will be necessary to prick off the seedlings, when large enough, into small pots of sandy and leafy soil, growing them on in a cold frame until June of the following year, when they should be planted out in a partially shaded position in the open. They may be grown in beds and borders in the open, but they are a great deal happier growing under conditions resembling that of a thin woodland, where large deciduous trees cast a gentle shade over them; light, however, is of importance, and such trees should be relieved of their lower branches in order that sufficient light may penetrate to the plants. If you cannot provide such a position, try and find one offering the nearest resemblance. A leafy soil is desirable, such as two parts decayed leaf-mould to two parts of good sandy loam. Some varieties prefer a little more sunshine, but the above conditions will be found acceptable to most of this attractive genus.

Anthemis tinctoria

(T. A.).—This fine Marguerite-like plant is best increased by means of cuttings inserted in boxes of sandy soil kept close in a frame—treating them, in fact, the same as those of the true Marguerites or Pentstemons. The plant is nearly or quite hardy, and the cuttings would be quite safe in a cold frame in any but the severest winters.

Planting Alstrœmerias

(E. J.).—These may be planted quite successfully in autumn or spring, provided the roots are in a dormant state. If more are purchased this spring plant them in open soil at a depth of not less than 9 inches, and mulch the ground above them either with cocoa-nut-fibre or light strawy manure. Few things are easier to grow than these, and once the plants are established they should be let alone, beyond annually mulching them, if necessary. Alstrœmerias are not always easy to establish, but if they are once fairly started they give no trouble afterwards, and should not be disturbed for years. They require to be planted in a warm, dry border, not less than 9 inches deep, to keep them safe from frost. If the soil is not naturally light and dry they will require some stones put below them.

Double white Daffodil

(J. M.).—The variety you require is probably The Pearl, a beautiful double-flowered Daffodil of delicate primrose colour passing off white. There is also the older double white Poeticus, snowy-white and sweetly scented, with Gardenia-like blossoms.

A dwarf Forget-me-Not

(Miss F. Mordaunt).—The plant you refer to is most probably Myosotis rupicola, a delightful but sometimes difficult plant. Yes, it comes fairly true from seed, and is offered by Messrs. Thompson and Morgan, seedsmen, Ipswich. Plants could be obtained from Mr. Clarence Elliott, Six Hills Nursery, Stevenage, Herts.

Diseased Gladioli corms

(Puzzle).—The two affected corms have a rot which we understand is at present under investigation by research wo It is not yet established as to whether the fungus concerned is actually par It may be that the fungus only enters which are not in tip-top condition stored. After the fungus has, by some r or the other, entered the corm it makes progress and destroys the vascular bu with the result that the corm fails to When lifting the corms this autumn sure that they are dried well before st It speaks well for your harvesting season because you had only two affected; many growers of Gladioli many failures this season due to this trouble. The affected corms can be de before planting if all corms are peeled carefully examined. It would seem w do this because the fungus is really sitic. The planting of affected corms be liable to contaminate the soil.

Forcing Border Carnations

I am entering in a local show on July some Border Carnations. The earlie these to flower is a scarlet, which comm blooming about the end of July. Car suggest any way or treatment which c given to these Carnations to make flower from three weeks to a month ea Also a few hints on growing hardy B Carnations would be greatly appreciate R. HOLLOW

[It is usual for exhibitors at these shows to grow their plants in pots in a or cool greenhouse, but it is too late no you to do this. The only thing, ther we can suggest is that you place frames your plants, attending well in the way ing, and seeing that they never suffer dryness at the roots. Watch also for ve as under such conditions these are apt troublesome. Details of culture can h be given in reply to a question, but i watch our columns you will get, from ti time, helpful hints on this matter.]

Bulbs in Grass

I find that Daffodils and Fritillaria generate in grass. By the third year planting they bear no flowers. Can yo vise any treatment? The grass is a field cut for hay, light stony soil, and position. The bulbs are not under the of the fruit trees. R. F.

[Your soil is probably too dry for bulbs, and it is somewhat difficult to su anything likely to do much good. You the bulbs are not under the shade of trees. It would be better if they were Daffodil in particular thriving splen when planted under deciduous trees. haps a dressing of fine bone-meal, 2 oz 3 ozs. per square yard, might do some Is the hay cut before the foliage is ri off? If so, this of itself would caus trouble.]

Botrytis parasitica and Tulips

(J. G.).—The specimens when they re us were much withered, so that it is dif to determine exactly what is causing trouble. We think, however, that the point to that troublesome disease know "Fire" fungus (Botrytis parasitica). taken in time and the discoloured piece removed with a sharp knife the troub arrested. You would be well advised, ever, to root up and burn all the aff plants. Tulips should have a fresh site season.

Border Carnations too warm

I am sending a struck cutting o Allwood's Perpetual-flowering Carna You will note the leaves have lost their b and are withering badly in addition. you give me any hints as to how to

? All my cuttings are going like this te old plants are becoming affected too. ants are in a span-roof house which lve practically to themselves. There is d p ventilation and side ventilation also. oor of the house is three steps below -level, but it is paved and is not unduly and the plants are upon a staging feet from the ground, the apex of the ing about 7 feet above the top of the g. The plants are in 3½-inch pots.

C. C. M.

A you not keeping your Carnations in rm a house? These Allwoodiis are fely hardy and dislike much in the way rficial heat. We can discover no actual ea on the specimen sent, but part of the ns discoloured, which seems to point to nistake in the cultural details. A dose rficial manure would cause it, so would r-atering, as also would dryness at the ts The plants would be better in a frame y intend growing them in pots, but ul be better still planted in the open d.]

GREENHOUSE

p astrum treatment

ould be grateful for advice as to the treatment for my collection of Hipsum which my friend, the late Sir ore Holford, gave me many years ago. have been neglected, I fear, by my late rdner, and become seriously affected by, I pse, mealy bug, though scarcely any are it. Two years ago there were a lot of n showing streaks of red in the leaves ic have since failed to develop properly, d his year many of the flowers have no v at all or are misshapen and small. I ve been treating them with methylated ri applied with a fine brush, but it does em of much avail. H. A. PETO.

fd Manor, Bradford-on-Avon.

ur plants are certainly in a very bad y You should shake them free of all soil, ff all loose skin, remove any decaying t and repot in a sweet, fresh compost d up of the best procurable fibrous loam, k leaf-mould, not too old, and coarse, a sand. Before repotting examine each lb carefully and kill any bugs or their eggs uching with spirit of wine, using a m-hair brush. After potting set in a u having a genial warmth of 65 degs. to gs. While the soil should not be permitted to get really dry, water must only be ve to prevent this, but the bulbs and pots old be lightly sprayed over, two or three me a day with tepid water. It would also ell to dust the bulbs before repotting ith crushed charcoal and sulphur. By ang in this way the bulbs should recover, d f they make good growth by the end of ly nove them to a sunny stage or shelf in dinary greenhouse and so get them prorl ripened off. They should rest from tion till early spring.]

rcping of Aralia foliage

(alia).—You need not be unduly alarmed your Aralia foliage dropping off. It is e natural habit of the plant to cast off val leaves after a new crop of leaves is evoped at the growing point. The conqence of this is always that Aralia Sieol becomes leggy in course of time. You nlo nothing to prevent the leaves falling f, although a moist growing atmosphere ee; them in position longer than is the case nc dryer conditions.

ROSE GARDEN

Ro leaves dropping

(F.).—We have carefully examined ou Rose shoot and can find nothing present that would account for leaves dropping, but the specimen shoot arrived in such a dried-up condition that it was impossible to do much with it. Will you be kind enough to send us another specimen, together with some of the leaves that have actually dropped off, packed in a small tin box. Such material should arrive in a fairly fresh condition, and we should be in a better position to find out the cause of your trouble.

SUNNY TORQUAY

1. Silene maritima, a sea-coast form of the Bladder Campion, on the cliffs along the Marine Parade.
2. Thatcher Island and clump of Pine trees as seen from the Marine Parade.
3. Magnificent specimens of Cordyline australis (native of New Zealand), now at their best in the Tea Gardens by the front at Torquay.

ALPINES

Primula Lady Thursby dying

(S. M. M., Co. Cork).—Your Primula was and is still badly attacked with wireworm, several being present among the roots submitted. As soon as their flowers are over lift the remainder, washing all the soil from among their roots, and transplant in sweet, fresh, moist ground, which has received a dressing of Vaporite. Should any of the plants wilt before flowering, cut out the flower spikes, which must be sacrificed this year, and transplant at once.

Primula maggot

(Middleham).—From your description we think that the maggot is probably that of the Clay-coloured Weevil (Otiorrhynchus picipes), but it would be more satisfactory to you and to us if you would be good enough to send us up some specimens. There are several soil creatures which could do the damage, and the control of these is somewhat different from that for Clay-coloured Weevil.

Primroses changing

I have a good collection of coloured Primroses (Acaulis). I find that about the second year the plants turn to Polyanthus. They throw up the long footstalk with the umbel of flowers. I have tried starving in poor soil, but even the common English Primrose changes. Our climate is cool. Seldom do we get any hot weather. The Primroses begin to bloom about November 1st and keep a constant succession of bloom till the end of April. Can you suggest any treatment to prevent the sporting? HUGH B. LOGAN.

Inverness, Marin County,
Calif., U.S.A.

[While it is not at all uncommon for the Primrose to develop the Polyanthus habit, we have never known this trait to be so universal as it is with you. We would suggest that you lift and divide the plants annually, replanting on a fresh site. You will understand that this plant prefers a shady situation, while moderately rich and moist soil gives best results.]

TREES AND SHRUBS

Cutting-back double Gorse

When can this be safely cut back to prevent the plants growing straggly? Can it be done a little every year to small plants just now put in? Can old plants which have never been cut be safely shortened, and, if so, where? F. W.

[If this is done annually whilst the plants are young, then it may be carried out with perfect safety, such pruning being done immediately the flowers are over. It is a risky practice to cut back old specimens, but if it is done at the end of April a large percentage will again break into growth, even though wood 2 inches thick has to be cut through, and we would advise this treatment where old plants have become leggy and unsightly.]

Rhus Cotinus dying back

(H. L., New Zealand).—This handsome shrub is happiest when growing in poor soil, and we suggest as the reason for the behaviour of your shrub that the treatment you have been giving has been too generous, possibly the soil too rich. This would also keep the plant growing late, with the result that the unripened shoots are unable to withstand the winter. We can give no other reason for the dying back.

Diseased Azaleas

I am enclosing a diseased piece of Azalea Pontica (common yellow). The shrubs were planted about two years ago on a slope facing east, and this spring we notice that they are covered with fungus. I would be obliged if you could diagnose it and suggest a remedy.

M. E.

[The "fungus" present on your specimens is not a fungus at all, but is a lichen and has had nothing to do with the death of the bush. Lichens commonly occur on various trees and shrubs, especially when growing under fairly moist conditions. From the evidence we have, it is difficult to account for the death of the shrub; it is probably a victim of the great frost. A badly drained site might have killed the plant.]

FRUIT

Weak and shrivelled Vines

(Gardener).—Your Vine is certainly in a very bad way, but without considerably more information as to condition of soil in which it is growing and the cultural treatment given we cannot definitely say what has caused the trouble, nor, of course, what can cure it. Most likely, however, the roots have got away down into uncongenial soil, the remedy for this being to remake the border in autumn or early spring, using the best procurable fresh turfy loam. We will give you full details of how to proceed if you so desire. If the Vine is growing inside the house it may have been kept too dry at the roots, or again, it may have been given far too much water. You have not been dosing it with strong artificial manures, have you? This, too, would do the damage.

Thinning Peaches

(Inquirer).—If the crop is very heavy you can partly thin before the stoning period, but, generally speaking, it is safer to defer until this is over, as some usually drop during this critical time. You do not require to stop syringing. It is hardly possible to inform you as to the exact stage of growth the fruits begin to stone; nor yet the exact length of time they take to finish this process.

VEGETABLES

Carrot Fly

(C. E. B.).—The adult Carrot Fly appears in May and June, according to the season, and eggs are laid on the soil close to the Carrot crop. The maggots emerge from the egg about seven or eight days later. The tiny maggots work their way to the Carrot root and begin to feed. If the attack is early the maggot appears to work its way to the tap root and eats this through, but if the Carrot has attained a fair size the attack takes place higher, and the fleshy part of the Carrot is attacked. When the maggots have been feeding for about a month they leave the Carrot and get away into the soil nearby and pupate. Some of the chrysalids remain in that state until the following spring, but a number of them only remain as chrysalids for about 21 days and then emerge as adults and commence egg laying again. This second generation is the one that does the damage to a crop of Carrots nearly half grown. The first generation is responsible for Carrots going off in the final thinning stage. The best control is to keep the crop dusted with a mixture of creosote and fine, dry garden soil. Two tablespoonfuls of creosote should be well stirred into 3 lbs. of dry garden soil. This is done by weighing out the soil and placing in a bucket; make a hole in the centre of the soil and pour in the creosote; then stir well so that the creosote is thoroughly mixed. If convenient, the mixture should be made up a day before required for use, so that time is allowed for the creosote to permeate the whole of the soil. 3 lbs. of the mixture is sufficient for 30 sq. yds. of Carrot bed. A Carrot bed should be dressed with this mixture at fortnightly intervals from the appearance of the crop until mid-July. After the creosote and soil are mixed in the bucket, it should be covered until used. Any left over should be placed in an air-tight tin or thrown away, and a fresh lot mixed up each time it is required. Each time a Carrot bed is thinned, the soil should be firmed so that the adult flies cannot get into the cracks to deposit eggs. A mulch of lawn grass cuttings over the Carrot bed 1 inch in thickness often prevents an attack of Carrot Fly.

Bean Aphis

(T.B.).—This feeds by piercing the tissue of the plant and withdrawing the sap. If the growing points are removed and burned a good measure of control is generally obtained. We have, however, seen many gardeners pinch out the affected Bean tips and, instead of burning them, throw the tips down onto the soil by the sides of the plants. This is a great mistake, because Bean Aphis does not remain on a drying portion of a severed tip for long. As soon as the portion on which the aphises are feeding is picked, unless they are at once put into water, the aphises begin to leave it and to look about for another host plant. Sometimes when infected tips are thrown down under the plants the aphises crawl back up the stems and begin to feed again by attacking the pods. This is always the case if the pods are only just forming; if, however, the young pods are fairly well advanced, another host plant is generally looked for. Bean Aphis attacks many plants, *e.g.*, Rhubarb, Turnips, Mangolds, Beets, Nasturtiums, Larkspurs, Docks, Thistles, Poppies, also Runner and French Beans. This list is not by any means complete, but it will serve to show that Bean Aphis, when thrown down in a garden, has plenty of choice for another host plant. When the "pinching" method of control is used for Bean Aphis on Broad Beans, it is essential that the affected portions after removal are burned or otherwise destroyed. In the case of your Runner Beans, picking off the affected portions is out of the question, because the plants are generally attacked more or less all over, and to remove the affected portions would mean the destruction of the crop. We should advise you to spray your plants with a good nicotine wash, many of which you will find advertised in our columns. If you prefer to make your own, you should use $\frac{3}{4}$ oz. 98 per cent. nicotine, 1 lb. soft soap, and 10 gallons water. Dissolve the soft soap in a little hot water. When the solution is cold, add the $\frac{3}{4}$ oz. nicotine and then make up to 10 gallons with cold water. Soft water should always be used. When the spray is used pay special attention to the undersides of the leaves. The spraying should be repeated if necessary.

Leaf Curl in Tomatoes

(W. C.).—If it is only the ordinary Leaf Curl you need not worry, as this is quite a natural process. All Tomato plants, as they get well advanced in growth, produce such foliage, this being merely a phase in their development, ending in the leaves ripening off. By careful watering and careful, but abundant, ventilation, you may defer the coming of the curl, but will not prevent it.

MISCELLANEOUS

Where to obtain plants

(Miss G. M. Walpole).—You can procure both Valotta purpurea and white Foxgloves from Messrs. Barr and Sons, 11, 12, and 13, King Street, Covent Garden, London, W.C. 2.

Use of pigeon manure

(Constant Reader).—Pigeon manure must be kept dry to be of any value. When thoroughly dry it crumbles into a fine powder and should then be scattered near the plants and hoed in. The plants that benefit most from this material are: Beans, Peas,
the Cabbage family, Turnips, Leeks
and Celery. If used as a liquid ma
peck to 80 gallons will be enough
benefit by the use of this manur
Chrysanthemums, Dahlias, Pen
etc., but it must be used very spari

Removing Pampas Grass

THE BOOK OF
THE TULIP

By SIR A. DANIEL HALL
K.C.B., LL.D., Sc.D., F.R.S.
Director of the John Innes Horticultural Institution

24 full-page plates (12 in colour)

FIRST REVIEWS

The Times.
"Of special value to all growers, whether elementary or ambitious. It treats of the history of the bulb, from the early days; describes the wild species, chiefly found in Central Asia, and the several classes—Dutch, Old English, Cottage, Parrot, Darwin—into which their countless descendants are divided. There are full directions for growing, hints on hybridising and seed-raising, practical notes on diseases of the family and scientific ones on its physiology. An admirable handbook for all admirers of the splendid flower. There are many plates, in black and white and in colour, of typical blooms of the various classes."

Times Literary Supplement.
"Sir A. D. Hall's book comes at a fortunate moment for all who have been taken, lightly or seriously, with the restored vogue of the tulip. In moderate compass and with easy authority it goes fully into the history, science and æsthetics of tulip-growing."

Of all booksellers, price 21s. net.

REMINDERS FOR THE WEEK

Southern and Midland

Fruit houses

With the removal of large bedding plants hitherto occupying the floors of these houses, one is able to pay closer attention to the condition of the borders, and whether occupied by Vine, Peach, or Fig, more light and air will now penetrate their surface, enabling such borders to dry out more rapidly, hence the necessity of more care in the matter of watering; airing, too, from this date must be on a more generous scale. A few plants, such as Indian Azaleas, Genistas, Acacias, etc., enjoy the partial shade of fruit houses and often recuperate rapidly from the unnatural treatment such plants receive during their occupation of dwelling houses, where they suffer from dark and overheated conditions. Thrips are, however, very troublesome among such plants and daily syringings must be given, otherwise this pest will spread to the trees overhead

Poinsettias and fibrous rooted Begonias

Continue to take cuttings of these, as they will be found valuable for blooming in small pots in mid-winter. A brisk temperature well charged with moisture is essential for quick, clean growth.

Plants for blooming next year

If seeds of the following are sown now, the plants will bloom next season and be found invaluable for the making of new, or filling up of old, borders. The borders in which they are sown should be well drained and the soil rendered to a fine tilth, shallow drills are then drawn out at 9 inches apart. The items include Aquilegia, Campanula pyramidalis and others; Canterbury Bells, the two latter kinds are excellent for potting-up to flower indoors during spring and summer; Brompton Stocks, Cheiranthus Allionii and C. linifolius, Delphiniums, Foxgloves, Honesty, Perennial Poppies, Anchusas, Gaillardia, Hollyhock, Coreopsis grandiflora, Wallflowers, Sweet William, Polyanthus, Chrysanthemum leucanthemum, and Forget-me-nots.

Newly made lawns

Those over which seed has been sown should not be mown with a machine the first time, it being far better for the grasses if the first cutting is done with a sharp scythe, and even this should not be permitted until the grass has attained 4 inches to 5 inches in height. Rolling of such lawns should be frequent during favourable weather, and when the mower is used for the first time avoid cutting low, or many of the roots will be drawn out.

Sweet Peas

The final staking must now be given to those planted out of pots; care must also be taken to avoid dryness at the root by applying a good, heavy mulch of litter alongside. Thin out late sowings to at least 1 foot apart and place small supporting twigs around them.

Annuals

The earliest sowings will now require thinning, such things as Lavateras, Bartonia, Cornflower, Larkspur, Hunnemannia, etc., requiring to be thinned to at least 1 foot apart, whereas Phacelia, Nemesia, Drummond Phlox, Rhodanthe, Viscaria, etc., need only 6 inches to 9 inches. Choice annuals may still be sown where they are to bloom, and often produce even finer results than those of an earlier sowing. The soil should be good, but not unduly rich.

Climbing plants

These are now making rapid growth, which must be trained into position week by week or a tangled mass, which cannot afterwards be separated, will result. Clematis are a case in point, but if these are taken in hand from the start, they may be trained to produce graceful effects.

Early Potatoes

The final earthing up should now be given, and if a sprinkling of Potato manure is applied between the rows at the present time it will be found most beneficial to growth.

Celery

The trenches having been prepared earlier in the month and the plants having been thoroughly hardened off, there need be no further delay in getting them out in their permanent quarters. A good ball of soil should be lifted with each plant and the latter made firm; for double rows a space of 6 inches—with the plants 1 foot apart in the rows—should be allowed. Water thoroughly and constantly should the weather prove hot and dry, especially during the first fortnight.

Vegetable Marrows and Ridge Cucumbers

These may now be planted out, they must, however, be sheltered from strong winds, and it may be necessary to protect them at night.

Runner Beans

Raised in boxes, these may now be planted out in prepared trenches, and others sown on rich ground. E. Markham.

Gravetye Manor Gardens,
East Grinstead, Sussex.

Scotland

Latest Peas

A long experience in a lake upland district has taught me that to sow late Peas after the end of May is to waste time, space, and seed. Certainly, if one is content to use the inferior early varieties, these may be put in 10 days or a fortnight later, but by sowing Rearguard and the Gladstone during the last few days of May, good-flavoured produce can be had up till the end of October or even later.

Brussels Sprouts

This popular winter green cannot be depended on to produce good crops if sown out-of-doors in March, in some of our later districts, unless it is an exceptionally fine season. It is desirable, therefore, to plant out a good breadth of the plants raised in frame or greenhouse, these having a start of several weeks and so invariably doing well.

The Swede Turnip

This is now recognised as one of our most useful winter root vegetables, and should be grown in every garden. If sown early the bulbs are large and coarse, but by putting in the seeds during the last week in May, decent size and fine quality are usually secured. Fairly rich, well-worked ground gives the best results, while a good field variety is much better than most of the so-called garden Swedes. One of the very best for garden culture is the Bangholm Field Swede. Sow in shallow drills 18 inches apart and thin to 8 or 9 inches asunder as soon as fit to handle.

Parsley

A sowing made now will be in good condition for pricking into a frame towards the end of August to provide a supply for the winter and spring months. I find Myatt's Garnishing very suitable for t
pose. Plants raised under glass, if
ready in their permanent quarters, sh
got out at once. Always plant near
so that supplies can be easily got a
kinds of weather.

Bedding out

This is now occupying the major
the working day, and, providing the
is favourable, should be pushed forwa
all speed. All the hardier subjects
of course, be planted first, leaving su
der kinds as Begonias, Dahlias, N
Marigolds, Ageratum, Nasturtium
until the first week in June. All the
planted stuff should have the surface
soil between the plants stirred with th
hoe. This greatly helps the plants,
discouraging slugs and keeping down

Dahlias

One of the drawbacks to the cu
these grand plants, especially in th
districts, is the lateness of bloomi
frost cutting the plants down in some
before a flower had expanded. Thi
mainly to the old show and Cactus
